Disappearing files, modem configuration woes, unauthorized Wi-Fi access, and retrieving Windows

With a slew of user queries hitting us every month, we get cracking by answering some of them to keep our readers happy. For further assistance on troubleshooting woes, write to us at sos@thinkdigit.com.

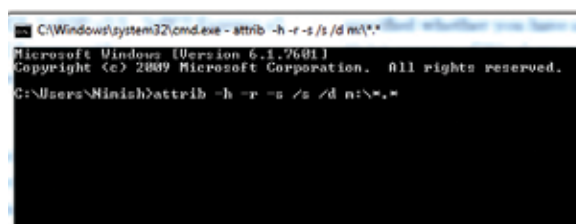

Folder is empty

I use a SiliconPower 8 GB pendrive regularly. My pen drive has 4GB of content but when I open and access it through Windows Explorer (through the My Computer icon), it shows "The Folder is Empty." What's weird is that I can see all the files through command prompt but not from My Computer and standard Windows GUI. Also, I tried turning on the option to show hidden files and folders but it did not work. I copied the contents of the pendrive from My Computer and pasted in a NewFolder on my PC's desktop. When I click on properties of this NewFolder, it shows 4GB size but when I open it, it shows "The Folder is empty." I use AVG Internet Security 2013 daily updated and performed whole computer scan but did not find any virus problem. I can't understand what could possibly be wrong with this pen drive. Please help me with this.

Ashtutosh Rai

A Since you have already clicked on 'Show hidden folders' and can view the files through command prompt, you need to follow these steps to make the drive show the folders.

Go to Start>Run>cmd. Type this command: `attrib -h -r -s /s /d x:\*.*` The letter x should be replaced with the drive alphabet of your pen drive. So if your flash drive is showing up on drive J for instance, then your command will be `attrib -h -r -s /s /d j:\*.*` Press enter and you are good to go. In case this does not work, then maybe the pen drive is damaged as it is not showing you the data which is clearly present on the drive. You may want to

use a utility such as Recuva (<http://goo.gl/MdCy>) to see if the contents are visible.

Configuring modem

I bought a DLink 2520U modem the other day and configured it properly and it is working with my BSNL broadband Internet.

I also bought a DLink DIR600L N 150 Wireless router. I connected the router with the modem using an ethernet cable, but I am not able to configure it properly, even after running the wizard the router is not able to connect to the Internet, whereas the modem which is directly connected to my PC can do so. Please tell me what are the steps to configure it for BSNL. Thank you.

Nishant Arya

A Your modem and router are probably having an IP conflict. First connect only your router to your PC without the modem and change its IP by going to 192.168.1.1 (usual default IP for web UI). Choose whatever you want such as 192.168.1.3. Next you'll need to put your router into PPPoE mode and enter your BSNL login credentials. And finally you'll need vpi and vci values. The process is a little complicated to explain in this little space. Head on here for more: <http://dgit.in/12Qrshk>

Shady business

What is that device that can catch Wi-Fi signals so that I can use my neighbour's Wi-Fi because it is not protected? My desktop doesn't have Wi-Fi or Bluetooth. I just need a device that can let me use

his Internet. And what is that device that spreads Wi-Fi signal? Please give the links to buy the cheapest one online in India. I would prefer snapdeal.com and flipkart.com. I have these motherboard slots:

xPCI, 1xAGP v3.5, 2xPCI Express x1, 1xPCI Express x16

Please reply as soon as possible

Abhay Kushwaha

A Well this one surely makes it to our "Weird Mail" archive. But instead of ignoring your absurd query we figured we might do more good if we actually took the trouble of guiding one of our lost lambs. In our reply, we will give you the tools you seek but let you decide which path you want to walk on. We will let you choose
