Q&A

your own destiny. Understand this Abhay, "using" your neighbour's Wi-Fi does amount to "stealing" no matter what euphemism you use for it. Your device will show up in your neighbour's network neighbourhood and he will easily know who is stealing his Wi-Fi. Expect a knock on your door one of these days for sure. Now for the technical part of your answer which might help others who are looking for the same info but for legitimate reasons. Wi-Fi network adapters popularly come in USB or PCIe formats. For a list of USB Wi-Fi adapters available on eBay follow this link: <http://goo.gl/AA5Ic>. For a list of PCIe cards here is the link: <http://goo.gl/u9XdT>. Take your pick options are available from ₹750 onwards. As for your last question, a device which "spreads" Wi-Fi signal is a Router. Unless of course you mean a repeater which extends the range.

Q Getting back Windows

I had a genuine Windows 7 Home Basic which I lost that when I formatted the system. I hadn't received Windows CD. But I have the product key with me. Is there any way to get back my genuine Windows installations?

Akhil Raj

A Yes, there is a way. You haven't specified whether you have a 64-bit or 32-bit version of Windows so you'll need to use the following link <http://msft.digitalrivercontent.net/win/X17-59463.iso> for the 32-bit version and <http://msft.digitalrivercontent.net/win/X17-59465.iso> for the 64-bit version.

You will then need to download the Windows 7 USB/DVD tool from <http://dgit.in/19jDetk> and install it.

Run the Windows 7 USB/DVD tool and follow the on-screen instructions to either create a bootable media.

Q USB dongle issues

A Tata Photon plus modem (Olive vme 102) was working fine on a Windows 8 Samsung laptop and a Windows 7 desktop. Sometimes the modem software acts up and an uninstall-reinstall sets it right. The last time I uninstalled it on my laptop and proceeded to reinstall, the laptop refused to detect the modem at all. I have tried all USB ports. Other USB devices are working fine with the laptop. The modem continues to work smooth on

the desktop. But the laptop doesn't detect the modem at all. What could be the problem? Any insights?

Generic SuperHero

A Make sure you don't have any USB firewall type app which blocks USB viruses by blocking autorun.inf.. disable or remove the AV program or any other such app. Uninstall all of the USB drivers from device manager under USB controller. Let windows re-install them upon reboot.

Run sfc /scannow from an elevated command prompt. Run CCleaner and registry mechanic (not free) – run deep registry scan (backup registry prior to that) – delete everything it finds – reboot.

Mount the modem without installing modem driver and see what happens.
