

HASWELL: THE FUTURE IS HERE

The long-awaited fourth generation Intel core processors, better known as Haswell, were released in June and there has been a lot of talk about the latest features and performance improvements ever since they were first released at Computex. With the latest chips out in the wild, Intel has said that it has tried to focus on improving three key factors i.e. performance, modularity and power consumption. The new chips, which have been fabricated with 22nm technology, have been developed such that they allow legacy code to perform much better,

**THE NEW CHIPS
ALLOW LEGACY CODE
TO PERFORM MUCH
BETTER, WHILE AT THE
SAME TIME PROVIDING
DEVELOPERS WITH A
WIDER INSTRUCTION
ARCHITECTURE**

while at the same time providing developers with a wider instruction architecture.

As such, the design philosophy while developing Haswell has been to retain previous Sandy Bridge and Ivy Bridge features such as Hyper Threading, Turbo Boost and Ring Interconnect, while at the same time providing a single converged microarchitecture that spans everything right from mobile devices to servers.

Intel has been focusing on providing solutions for devices available in new form factors like ultrabooks, tablets, multi-purpose laptop-cum-tablets etc. Until now, chips like the Intel
