control over the cooler by using the LINK system software which allows for monitoring and control over the fans and lights and set profiles for the cooler using a USB header. H80i and H100i both have the same SP-120L fans and both of them use an easy magnetic mounting mechanism for the pump which is intelligently powered using a SATA power connector. Temperature wise or rather performance wise, the H80i and the H100i are decent but both of these coolers lose out points due to the fact that their fans are loud under full load. They both got beaten by the Cooler

Master Seidon 120XL which has almost a similar sized and thick radiator as the H80i but cools slightly better. It is also good to see that CM has included extra thermal paste with each of its coolers and sad to see that none of the other liquid cooler manufacturers have done the same.

Next up, we have the 240mm radiator based Cooler Master Seidon 240M which is similar to the other Seidon coolers in the accessories and features aspect and its radiator has the same dimensions as the radiator present in Corsair H100i. The Seidon 240M is silent and cools better than the

Corsair H100i and if you are a person who does not care about digital monitoring and fan control or you think that it is just an unwanted utility, you can skip the Corsair H100i and buy the CM Seidon 240M. You may even get the Seidon 240M at a best buy price of ₹7,300 and it is a great buy for that price.

We also had 140mm fan based liquid coolers from Corsair and NZXT participating in the test, out of which the Corsair H90 has a 140mm radiator but the NZXT Kraken X60 and Corsair H110 both have 280mm radiators which allow you to install two 140mm fans side-by-side. In

fact, the NZXT Kraken X60 and the Corsair H110 had the largest radiators as compared to all the other liquid coolers in the test. Although costly, the Corsair H90 is better in performance than most of the coolers and is second best after the Corsair H110. The NZXT Kraken X60 on the other hand has digital control software called "KRAKEN control" by NZXT and it allows you to monitor and control fan speed, set profiles and change the pump LED illumination.

VERDICT: LIQUID COOLERS

Seeing the results you can say that, though liquid coolers are costly, they beat air coolers by quite a margin which concretely concludes that liquid coolers are the way to go for computer enthusiasts building mid-end to high-end rigs for gaming or overclocking purposes. In this test, Corsair H60 received the Best Buy award for being a cheap performer. But we also suggest you take a look at the Cooler Master Seidon 120M which performs much better than the Corsair H60 and you may get it at a street price of ₹4,500 which is cheaper than the H60.

The Best Performer award goes to the Corsair H110 for being very silent yet cooling the CPU very efficiently at full loads. The next best cooler in terms of overall score i.e., the NZXT Kraken X60 receives the Editor's Pick and is a worthy prize winner and you can go for it without thinking twice especially if you get it at its street price of ₹8,100. If you want to check out a more detailed account of the comparison test then head over to this link:
