Tag Manager

Google recently launched Google Tag manager for mobile apps with Analytics services SDK: <http://dgit.in/GTagMgr>

Condensation Nuclei

The vaporous, but oh-so-tangible reach of the internet is encompassing every facet of our day-to-day lives. We take a look at some of these news-making events that took place over the last month

Google's 5-minute downtime plunges global internet traffic by 40%

On August 17, the unthinkable happened – Google, and all its services such as Gmail and YouTube, went dark for a duration that spanned a single minute to five minutes starting from 4:22 AM to 4:27 AM IST. As a result, global internet traffic crashed by 40% as users couldn't access any of the dozens of hugely popular services that the search giant runs. The number-crunching was done by GoSquared, a Web analytics company who also noticed that global web traffic spiked once Google was back up and running.

This number (scarily) proves how intensely everyone relies on Google. In spite of the clear effects that its health has on the global internet, Google has refused to divulge any details about why the blackout happened, responding merely with a statement that said:

"Between 15:51 and 15:52 PDT, 50 percent to 70 percent of requests to Google received errors; service was mostly restored one minute later, and entirely restored after 4 minutes."

Facebook adds web embed support for public posts

Facebook has introduced Embedded Posts, which allow users to embed a public post on third-party sites. Currently, Facebook's new feature is avail-

Embedded Posts is not yet available for all users

able with CNN, Huffington Post, Bleacher Report, PEOPLE and Mashable. Broader availability is expected later this year.

"Today, we are beginning to roll out Embedded Posts to make it possible for people to bring the most compelling, timely public posts from Facebook to the rest of the web," said Facebook in a post.

"Embedded Posts let people add public posts from Facebook to their blogs or websites. When embedded, posts can include pictures, videos, hashtags and other content. People can also like and share the post directly from the embed."

Facebook's Embedded Posts is very similar to embedding features on Twitter, Vine, Instagram and YouTube. Read more about the Vine web embed and Instagram web embed support at <http://dgit.in/16sRMCP> and <http://dgit.in/18aNe8T>

There's also an option to visit the post's comments, photos, hashtags and other content on Facebook. To learn more, visit Facebook's Embedded Posts documentation at <http://dgit.in/1d4J4RT>

The social networking giant recently introduced hashtags, another popular feature on Twitter, in a bid to encourage public sharing on the network. However, a recent study claims the hashtags have failed to drive engagement on the social networking.

Google Search updated to show more in-depth articles

Google has rolled out a nifty update to its Search. Now, users can see more in-depth articles in the main Google Search results.

According to Google, the results are ranked algorithmi-

more than a quick answer. Our research indicates perhaps 10% of people's daily information needs fit this category – topics like stem cell research, happiness, and love, to name just a few. That's why over the next few days we'll be rolling out a new feature to help you find relevant in-depth articles in the main Google Search results."

Yahoo acquires social web apps maker Rockmelt

Yahoo CEO, Marissa Mayer, has bought her 21st company during her stint at the web giant, and this time, it's social browser maker Rockmelt.
