Q&A

Random Reboots and overheating issues

Hi, I've recently been having random reboots on my computer, especially while gaming. No BSOD, just the monitor going blank and the system rebooting. The problem as of yet has not occurred while anything else (Photoshop, Illustrator, 3Ds Max etc all run just fine). Also, I've seen frame rates dropping sometimes while playing Fifa 13, Sleeping Dogs & Skyrim (these are the only games I play). Could this be a GPU problem, or can the problem be related to RAM or the PSU related? When I play Skyrim at any setting whatsoever, it causes the PC to reboot within 5

Idle Temps: CPU: Average- 61.6°, GPU: Average- 55.4°
After running Prime95 (Blend, 15 mins): CPU: Average- 97.2°, GPU: Average- 55.5°
There is no aftermarket cooler installed in my system and the fan positioning inside the case is default. I've been using this system for more than a year now. Please take a note that I have installed the RAM sticks from my backup computer but that DIMM has been running fine for nearly a year. Any help regarding this would be really appreciated.

Install all pre-requisites for Catalyst Control Center

Windows 8 x64 and it came with Intel HD graphics Driver v9.17.10.2932. Then I downloaded AMD mobility drivers for the 7670M, uninstalled the Intel HD drivers and installed the AMD 13.8 Beta drivers. However, when I restarted the laptop after installation, and tried to start Catalyst Control Centre, it gave a weird error saying: "AMD CCC cannot be started. There are no settings that can be configured using CCC." The hotkeys for brightness control don't work too. Please Help.

Re-apply the thermal paste every few years

minutes, while I can usually play FIFA for 2-3 hours without any problem. Nothing other than gaming causes the reboots.

My system:

- i5-2500k;
- Intel DH67CL;
- GT 430;
- 1x4 GB G.Skill RipjawsX DDR3;
- Cooler Master Thunder 600 Watt;

Here are the temperature readings for your reference:

A This seems to be an Overheating issue. First, you should check your CPU cooler if its working properly or is it seated properly. Run Prime95 blend test for 15 minutes and play a resource consuming game again for at least 30 minutes. Note whether there is any difference in temperature. If it still doesn't change then you should buy a good quality Thermal Paste. The Arctic Silver 5 is a good TIM to consider. Clean the CPU surface by using a piece of cloth and some Iso-Propyl Alcohol (available at chemists). Apply the thermal paste to your CPU as shown in the picture, a small amount of it at the centre should be enough. Re-install CPU cooler, run tests again and check the difference in temperature.

Display Driver trouble

I recently got a new laptop; the HP Pavilion G6 2303TX, with 7670M. I installed

A Make sure that you have .Net framework 4.0 installed on your system because it is a prerequisite for Catalyst Control Centre and the program can't start without it. In case you don't have .Net framework installed, then head here: dgit.in/dotNetFwork, download and install it. Next download and install Leshcats 13.1 from here: dgit.in/LeshCatsDId. For ease of use, take a look at the installation guide which can be found at: dgit.in/LeshManual. Unified LeshCat AMD drivers are very stable and they would work fine. As for the hotkeys for brightness control, you can search for quickset drivers for brightness control and download them. This should solve your issues.
