

based services. Many users prefer using their desktops as their primary work space, and all important and urgent documents are mostly pasted there. So backing up your desktop on the cloud seems like a viable option. To do this, simply go to the Users folder under C drive where Windows is currently installed. Then right-click on Desktop, go to Properties > Location. In the

Never miss out on an unread email again

window that appears, replace the desktop location in the filled in field with the location of your SkyDrive folder and you're good to go.

Sync folders the easy way

There are some really awesome add-ons that enable you to easily sync folders with SkyDrive without manually transferring the folder. The Sky ShellEx extension, which is available in various compatible versions, helps you do just that. On installing the above mentioned extension from <http://ssx.codeplex.com/> you'll be able to sync any folder on your system by simply accessing an option called 'Sync to SkyDrive' in the menu that comes up after right-clicking on the folder name. All files in this folder will then be automatically backed up on the cloud. Isn't this a neat way to sync a folder? Syncing can be stopped by a "Stop Sync to SkyDrive" option in the right-click menu.

Add SkyDrive support on Gmail

It goes without saying that Gmail is the most popular email client. And since it's a Google product there's obvious support for Google Drive. SkyDrive support can be enabled using a third-party application called Attachments.me. Download the extension available for Chrome from the Web Store at <http://dg.it.in/18ygPIK>

Grant necessary permission to the third-party app and continue installation, during which you'll be required to sign in to your Gmail and SkyDrive accounts. Once this process is done, you'll be able to attach files from your SkyDrive account directly into your Gmail interface. You'll also be able to direct incoming mail attachments to your SkyDrive.

2. Outlook

Outlook provides an easy and much ignored way of keeping track of incoming mail, calendar and contacts. In this section, we share with you a few tricks that only the select few know and it should help you get the best of Outlook 2013 on Windows 8.

Save downloads directly to your Skydrive

Link with social media accounts

You can easily sync your Facebook and LinkedIn accounts to your People module in Outlook. Simply go to File > Info > Account Settings > Social Network Accounts, select the required social media service, provide the account details and grant Outlook permission to access your accounts.

Change what 'Read mail' means

Mail clients generally mark read and unread mails differently. A 'read' mail usually means a mail that has been clicked, or even been given a passing glance. This way you can miss out on some vital information and seeing the mail as read, not come back to it later. You can change the way Outlook marks mail as read by going to File > Options > Mail > Reading Pane. Now check the box titled 'Mark items as read when in Reading Pane'. Change the number of seconds in the 'Wait n seconds before marking item as read' box below. Now Outlook will wait for those many seconds for the mail to be in the reading pane before marking it as read.

Use the Favorite option

If you have multiple email accounts it might be cumbersome to navigate through different folders. In such a case, adding folders as favorites simplifies the process of reading your mail. Go to View > Folder Pane and enable 'Favorites'. Add any folder to the Favorites by right-clicking the folder pane and choosing the option of "Show in Favorites."

SkyShell adds new context menu options

3. Reader app

Reader app in Windows 8 comes as a native app. While it's not as powerful as your traditional Adobe Reader or Foxit, it serves its purpose and is extremely user-friendly. It largely serves its purpose as a utility app for reading documents.

Save files on SkyDrive

Most applications on Windows 8 will come with integrated SkyDrive support as does the Reader app. You can save the current document to the cloud storage option by right-clicking. Then Save > Give filename > Select SkyDrive (as save location) > Sign in on SkyDrive > Save. After successfully logging in to SkyDrive, click 'save' once again to back up the file on the cloud.

Add notes to a PDF doc

While this is hardly an innovative feature in a reader, the fact that it's built in for a lightweight native app is quite impressive. To take down notes, highlight the text you want to use in your note. Then right-click and click on 'Add a Note'. The note will be saved and a red symbol will be placed to signify addition of a note. ■
