Surface 2 and Surface 2 Pro

Microsoft has finally unveiled the latest versions in its Surface line up. The Surface 2 is built on the Tegra 4 platform while the 2 Pro is x86 Haswell.

aggregate the total number of posts that are mentioned for a specific term at a given time. The public feed API will gather and display public posts. A Facebook spokesperson stated in an email that if a post is not public it won't be shown. She compared the feed to similar services provided by Twitter.

She added that if someone doesn't want a Facebook message to be used in the news feed, users can select the proper audience for the message while posting it. Facebook added that the access to the APIs will be sent to a limited selection of news organisations such as CNN, NBC's Today Show, Slate, The Economist and Sky TV in the U.K.

Google+ now allows embedded posts

Google+ has finally launched embedded posts following in the footsteps of Facebook and Twitter. With the new embedded posts feature, users can grab relevant posts and add them to their websites to make a point. The embedded

feature supports texts, images and media posts.

The feature will allow site owners to add their public Google+ posts to their web pages. They'll be given the codes needed (including a JavaScript snippet and an actual embed code) to integrate posts into their sites. The embedded posts are interactive, so visitors can comment on or even follow the posts. The feature will be available on the public posts and can be accessed from the dropdown menu present on every Google+ post.

Along with embedded posts Google has also launched authorship to Google+ sign-in. The feature will allow users' work to be automatically connected with their profiles once they sign in with Google+. The feature has been launched for WordPress and Typepad, and will soon be available for About.com, WikiHow and The Examiner.

Google+ Director of Product Management, Seth Sternberg

An example of how to embed Google+ posts

stated, "So if you sign in to WordPress.com with Google, for instance, the articles you publish will now be associated with your Google+ profile automatically. With this association in place, we can look for ways to surface your info when it's most relevant. For example, today users may see your name, picture and/or a link to your Google+ profile when your content appears in Search, News and other Google products."

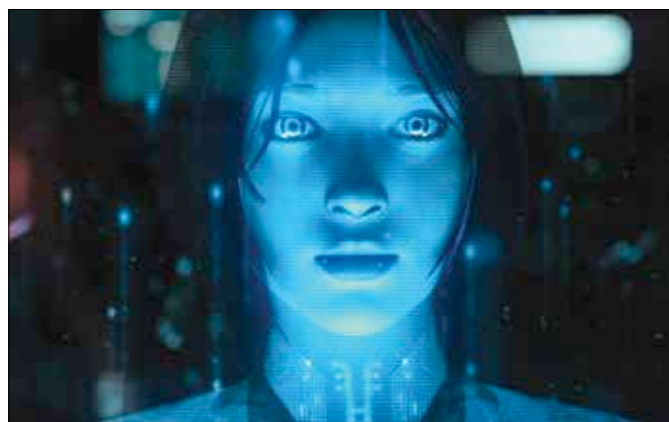

Microsoft's 'Cortana' to take on Siri and Google Now

In response to Apple's Siri and Google Now, Microsoft has plans to thwart its rivals with its

ability to pull in notifications, weather and location info, calendar details, and the best part – Cortana's ability to access the phone's Bluetooth capabilities.

The brainchild behind Cortana is said to be Bing's Satori engine – a colossal knowledge database, named after the first step on the Buddhist path to enlightenment.

Senior Microsoft officials have been constantly hinting that the software giant has been working on such an assistant for a while now. Earlier this year, CEO Steve Ballmer wrote: "Our machine-learning infrastructure will understand people's needs and what is available in the world, and will provide

Cortana is the friendly AI featured in the Halo games

first-ever fully-featured digital assistant – Cortana.

Early leaks of the much anticipated Windows Phone 8.1 (rumored for a launch early next year) OS included an app listed as "zCortanaApp" – the "z" in the name indicating that it was a test build. Cortana is the codename for Microsoft's voice-controlled, adaptable digital assistant, and is claimed to be much smarter than Apple's Siri.

Microsoft is already in the process of testing Cortana's prowess. Testing is being done on parameters such as the

information and assistance. We will be great at anticipating needs in people's daily routines and providing insight and assistance when they need it."

While the first signs of Cortana have been appearing in Windows Phone 8.1, ZDNet's Mary Jo Foley mentioned that eventually, Cortana will be the core experience integrated into future versions of Windows, Windows Phone and the Xbox.

Those of you who've played the Halo games on Xbox will recognise Cortana as the AI character that has the ability to learn and adapt.
