MISTAKES TO AVOID THIS SHOPPING SEASON

Unsure of what to watch out for in the gadget that you're splurging on? Here's a handy check-list that should get you through your entire shopping experience unscathed

Team Digit

1 Touchscreen laptops are a mixed bag

Touchscreen laptops can be fun, they surely add a new dimension to the way you interact with the PC. But, not all touchscreens are the same in terms of quality, uniformity and response. In our testing experience we have come across quite a few touchscreen laptops with inconsistent touch-response and a whole pile of other issues; all because of an el-cheapo digitizer. Apart from the touch response, you also should be aware of the importance and real world usage of a touch screen for your work environment. If touchscreen is just a "nice to have" feature, we'd suggest you think twice before paying a premium for a touchscreen laptop. Touchscreen adds marginally to the weight, reduces battery life and can be expensive to replace in case of an accident.

2 Aperture Range is as important as the starting Aperture itself

Did the salesman just show you a camera for 15K with an aperture of f/2.8? Did that get you incredibly excited, almost enough to flop that cash at the checkout counter? Don't. That f/2.8 will quickly change to a black-hole like f/4.8 (or worse) and you're better off trying to sketch the scene than photographing it at this aperture. Go for a camera which has a smaller aperture number printed on it, something like f/1.8-2.8.

3 Unlock issues: Ensure it'll work in India

Another thing you need to ensure when picking up a phone from abroad is the compatibility with the mobile networks in India. A lot of websites sell unlocked phones, mostly originating from the U.S. Market. Before placing the order, double check with the seller/web-site about the global network unlock status of the device.
