

23 Screen size vs the screen resolution
A common mistake that people make is in choosing a larger screen over a higher resolution. What really matters is the pixel pitch and what's comfortable for your use. Anything over 300ppi is excellent and unless you legitimately need a 6" display on a phone, don't go for it.

24 Regular updates
Regular updates are essential for a fun, smartphone experience. It's no fun when you're stuck on ICS while the whole world is going gaga over JellyBean. Many companies are a bit lax when it comes to dishing out updates and some might even have a reputation for abandoning support for older products. Research well before you buy. Forums are a great source of such information.

25 Why the Entry-Level DSLR is not necessarily best for Beginners
We often come across people wanting to buy an entry level camera because "they're just starting off." It's by far the worst excuse ever to justify the purchase. An entry-level dslr might seem like a good option, but you'll get over it sooner than you might think. Wait a few months and go semi-pro. You won't regret it.

26 Check for upgradability
Laptops are usually quite limited when it comes to their hardware, a side-effect of their form factor. Regardless, it's always good when you have the option to upgrade at a later date. Either in the form of an extra RAM slot or even an extra HDD bay.

27 Slim form factor has its issues
Just because a tablet is slim doesn't mean it's awesome. As with laptops, a slimmer tablet means a slimmer battery and a hotter device. The build quality is also usually compromised. Don't just go by hype.

28 AMOLED vs. IPS vs. ClearBlack vs.....
Phones have such an assortment of displays and each one claims to be better than the last. As a rule of thumb, IPS panels are the best in terms of image quality, but only if they're calibrated. OLEDs and AMOLEDs are the most vibrant due to their pitch black blacks, but they usually have a green colour cast. Standars LCD panels are cheap. Good ones are decent, bad ones, terrible.

29 Just because you have a GPU doesn't mean that you can game

The fact that a gaming laptop needs a good GPU is a given, but you must remember that there are other factors to consider as well. A laptop that's too slim and/or not well-ventilated will overheat, a native resolution that's too high will ruin your game and the lack of an SSD will teach you the virtues of patience.

30 More expensive doesn't mean the best

You will find tablets priced all the way from ₹10,000 to ₹50,000. Sure the iPad is still the king of tablets, but if you're on a tight budget, you may get an impressive device for a lower budget. Tablets such as the Lava ETab Xtron Plus are priced under ₹10,000 but are great at what they offer. Similarly, the first generation Nexus is still a great buy for ₹14,000 when compared to the other ₹15,000 tablets available in the market.

31 Aural prowess

It pays to listen to your future mobile phone's speakers before you buy it. Many phones have some of the largest displays with the tinniest speakers ever made. Also remember that not all speakers are made the same and while some may have excellent treble, others might have improved bass (whatever little that can be managed from a speaker that measures 1cm across). Also, a speaker that is optimized for voices is more preferable in a mobile device. Call up a friend, have him talk to you and listen for clarity.

32 The DSLR is king, the mirrorless the court Jester

It's shameful just how salesmen often say that a mirrorless camera is inadequate when compared to an entry level DSLR. Nothing could be farther from the truth. Yes, their AF systems aren't as evolved, and that they may not have three dozen lens options to boot, but what you do get is an incredibly compact camera with the SAME image quality as that of an entry level DSLR. Yep, you read that right. The same quality. For most users, that's more than they'll ever need.
