Ballmer's problem

In a post-PC era, Microsoft's finding it difficult to quit the PC industry
<http://digit.in/15JDW0L>

The Toshiba Canvio Slim S-3600A was another slim drive in the comparison. In fact, the S-3600A was the smallest drive when compared to the others. It has an appealing design with a black brushed metal casing and silver coloured accents along the sides. Toshiba's backup software greatly adds to the Canvio Slim's features. The performance of the S-3600A is good and it is a decent drive for ₹4850. The next 500GB drive is again from Toshiba – the

Toshiba Canvio Slim S-3600A

DTP105. While not as well built as the S-3600A it has a curved design at the sides and a brushed plastic top. A noteworthy feature of this drive is the internal shock sensor. While in operation, the drive senses if it is falling and powers down before hitting the floor. The performance of the Toshiba Canvio Simple DTP105 was at par with most of the drives but its brother – the Toshiba S-3600A was better.

Verdict (500GB Drives)

Among the six 500GB drives we received for the comparison, we were happy to see that most of them had a strong metal body which is something we'd like to see with all upcoming drives. The difference in performance between most of the drives featured here is very low but the features and build quality scores allowed for an accurate comparison. The **ADATA DashDrive HE720** wins

the **Best Buy award** for being one of the cheapest drives while performing quite well. The HE720's design complements ultrabooks with its sleekness and would be ideal for anyone who needs a 500GB drive.

1TB OR MORE

This category is for users who have a knack for archiving every content they lay their hands on and specially for those people who carry a lot of data with them. You might notice that the price difference between a 500GB and 1TB drive isn't much. And people who are unsure about their storage requirements usually take into account this price difference and go with the 1TB drives. It's not rocket science that this it is economical since you get almost double the amount of space for a few hundred bucks. We ended up with nine 1TB drives and a 2TB drive for this test. Some of the drives had a sturdy build which is something we wish to see more of. These rugged drives use two or more types of padding around the drive in order to protect the drive and increase its durability.

The ADATA HD710 was one such rugged drive. Some people may remember its older version – the ADATA Superior SH93 which was an ultra-durable, water and shock resistant drive. The HD710 turned out to be a worthy successor and this one also has an IEC 529 IPX7 waterproof rating. The design of the ADATA HD710 is quite similar to the older version but with a few changes. The old one was covered with rubber all-around but the HD710 is only layered from the sides. A small portion of the drive's plastic area is exposed from the centre. It's designed to keep up with the

same two colour ideology as the older drive. There is a slit around the sides to accommodate the cable snugly.

The next 1TB drive was the ADATA DashDrive HV620. The HV620 is a simple looking drive with a glossy plastic casing. Though it looks good, it is prone to fingerprints and scratches. The HV620 like all the other ADATA drives can make use of the HDD-to-Go utility to in order to install portable software on it. This drive lost a few points for being one of the flimsiest drives in terms of build quality but its performance was slightly better than the ADATA HD710.

The HPP2100R looks exactly like the HPP2050B except the fact that the drive comes in red colour. The P2100R performs better than the Transcend StoreJet 25M3 but loses points when you bring the features and build quality aspect of the drive in focus. We only received a single drive from Silicon Power for the test which was the Silicon Power Armor A15. The Armor A15 is another one of the rugged drives in the comparison. Silicon Power seems to have meticulously designed this drive keeping protection and durability in mind because the Armor A15 meets the U.S. military drop test standards. With a full body rubber jacket around it, the A15 is well protected and has a one-touch backup button at the top to aid users while performing backups. The Armor A15 uses the Toshiba MQ01ABD100 internally but it seems that Silicon Power has tweaked it a bit because the performance of the A15 in both the synthetic benchmarks and real world tests was exceptional.

Seagate's Backup Plus SRDOSPO 1TB has exactly the same features as the 500GB Seagate Slim but the major differences are the storage size and the drive thickness. Seagate SRDOSPO also

supports Seagate Dashboard software. You also have the removable SATA to USB3.0 adapter attached to the SRDOSPO.

The next drive on the table is the Transcend StoreJet 25M3 which is a rugged portable drive competitor from Transcend. The 25M3 has a pocket like design with curved edges and a rubber coating on it. The drive also supports one-touch backup functionality by making use of the included "Transcend Elite" data management software. The drive supports recovery functions as well by making use of RecoverRx software.

Starring next in our portable hard drive comparison test feature film are a few drives from Toshiba. The Toshiba Canvio Simple DTP110 is a drive which has looks similar to the 500GB Toshiba Canvio DTP105 drive that we saw previously. It has a plastic casing and a brushed finishing on the top. The sad part about the DTP110 is that there wasn't any information about backup software for this drive listed anywhere. Obviously, you can use Toshiba's NTI backup made EZ utility but it wasn't featured anywhere on the product packing. Thus, we haven't given the drive

Silicon Power Armor A15
