HP ENVY TouchSmart 14

The better ultrabook - excellent performance and battery life

There is no doubt that the ENVY TouchSmart 14 feels solidly built and our standard build quality tests match up to our initial impressions. The keyboard on the device is also excellent. HP seems to be working on its keyboards as the last few notebooks we've received from them have sported some of the best keyboards we've seen on Windows laptops. The design is very similar to that on the MacBook Pro 13 and thus, the keys are comfortable with precise travel and a sharp response.

The performance numbers are good, but not in the same

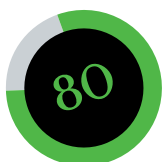

league as the Core i5-3317U or the Core i5-3230M Ivy Bridge chips, but that's a small price to pay for the massive improvements in battery life that Haswell promises. The Intel HD4400 graphics also performs only slightly better than the HD4000 series.

The TouchSmart 14 registered 251 minutes in the battery benchmark test. When used as a primary laptop, the battery lasted around 6.5 hours - brightness set at 70%, Wi-Fi connected throughout and music playback via iTunes for a couple of hours. This is more probably due to the presence of the Haswell chip than anything else. Still, the battery life is a bit short of the best we've seen.

The HP ENVY TouchSmart 14 is an ultrabook that should appeal to most people. It's well-built, has an excellent keyboard and Haswell is an added bonus. The performance is consistent and the machine a delight to use. This is an excellent device and you really can't go wrong if you pick one up.

Nokia Asha 501

The ideal first feature phone

For its price the Asha 501 has a very good touchscreen. The design of the 501 takes a leaf from the Lumia series of smartphones, making it one of the best-built budget phones in the market. It isn't polycarbonate, but the plastic is very strong. The performance of the rear camera is lacklustre. The interface is interesting. You can swipe down at any point, just like Android to see your notifications. It comes preloaded with a bunch of apps. The graphics of the games are very basic and there are no accelerometer capabilities on the device.

Spice Coolpad Mi-515

A run-of-the-mill Android smartphone

The Coolpad Mi-515 has a design very reminiscent of Samsung's Galaxy series. The UI is a lightly skinned version of Android and comes preloaded with a bunch of apps. The preloaded security apps are interesting. One such app is the Vault, which keeps content secure. The touch response of the display is good for playing games, navigating websites and for typing. The biggest downside of the device is that the resolution of the display, which is very low.
