

GOOGLE TOOLS YOU SHOULD KNOW ABOUT

Google's come a long way from the research project it used to be back in 1996. From the world's first commercially successful search engine, this company's branched out to become one of the world's most trusted cyber-world corporations. From delivering your emails and showing you the way home to managing your money and social life, The Big G takes care of it all. Although this has made several people more paranoid about trusting a virtual entity, it does seem to make life a lot more convenient in more ways than one. There are several features Google offers that haven't been explored to their full potential yet, and some that most people may know absolutely nothing about. Here are a few interesting facets of Google's wide-spread portfolio that you should know about:

Plan your free time with Schemer:

Everyone plans, plots, and schemes. Google's Schemer is like having a social networking website solely for the sake of your own personal plans and schemes. It's the 'Facebook events' of websites. A place where one can make plans to Goa and call a mixed group of friends (and, if you're feeling socially experimental, then maybe a bunch of complete strangers that you couldn't possibly know anything about). The app could use some refining and possibly a touch of publicity but it has potential for harebrained plans and arranging cultural events and rallies, maybe even a flash mob or two (an authentic flash mob. Not the planned stuff that happens in malls and public places in India). Admittedly, the range of this app is somewhat limited

{ Tips & Tricks has its own page numbers, and does not follow the rest of the magazine's page numbers. This is done to ensure that you can cut out and save T&T in a separate folder for later reference. }

for our country, but there is a scope for improvement, and one should keep an eye for any kind of update.

You can try out schemer for yourself at the official website: <http://www.schemer.com/>

Jazz up your text with Google Fonts:

Google Fonts (which was previously called 'Google Web Fonts') is an open source database of fonts available for both private and commercial use. The font developers use this as a platform to display their talent, and you can make your website and

professional showreel look a bit more unique than it would have otherwise.

Check out Google Fonts for yourself at: <http://www.google.com/fonts>

Look to the Google Sky:

A spin-off of Google Earth, Google Sky goes a few light years beyond physical experience. Putting together data and extrapolations of NASA and other space agencies, this software brings stargazing straight to your computer screen. Not quite like having the Hubble at your fingertips, but the closest

we can get to that. <http://www.google.co.in/sky/>

Organize your thoughts with Google Keep:

Much like the numerous diary apps on the Apple, WP8 and Google Play stores, Google Keep is an app to consolidate your daily thoughts and ideas in one place and store them on the cloud. At first glance, Google Keep does absolutely nothing different. The only reason one would suggest this feature to you is the fact that it syncs data with the very popular Google Drive. This makes it easier for people to sync their Keep notes with every device they own, making it a virtual storage space for those inspiring moments where you need to write your thoughts down for reference, and then can't remember when you need to because it's on your PC (or in the classical way, you wrote it down on the first piece of paper you found, which vanished a few minutes later. Download the app from your respective phone app store and find out more about this feature at: <http://dgit.in/googlekeepintro>

Code your way to Dart:

Not to be confused with DoubleClick, which used to be called Google Dart, Dart is Google's self-developed open-source programming code. Its initial purpose was, in the words of Mark S. Miller, "ultimately to replace JavaScript as the lingua franca of web development on the open web platform." It is a class-based, single inheritance, object-oriented language with C-style syntax. It was designed to be so simple that even beginner developers could use it.

The code is available for people online at: <http://www.dartlang.org/>
