

Yuletide Geek

Need to buy a Christmas present for a geek? Bring in your naughty and nice list and cross-check here <http://dgit.in/xmasgeek>

Telltale Thrones

Telltale Games, the studio that made The Walking Dead, plans to develop a Game of Thrones video game <http://dgit.in/tlothrns>

As far as Android management tools go, Moborobo is simple, efficient and a definite favourite for control freaks and people suffering from obsessive compulsive disorder.

To install, go to <http://www.moborobo.com/> and download Moborobo. After installing, launch Moborobo. Once it starts, plug in your phone and wait for Moborobo to detect it. In a few seconds, your phone will be visible on your Moborobo dashboard, and the software will take the liberty of installing Mobo Market and Mobo Daemon on your device for you. If you don't wish to use any of these, go ahead and uninstall them. It will make no difference with respect to your PC application. Mobo Launcher, Mobo Read and Mobo Play are all readily available for download in the Google Play Store.

Airdroid

Airdroid takes phone management to the level of cloud computing. It syncs with your Google account and allows you to access your device wherever you are, assuming you have a working internet connection and a web browser at your disposal. It also has a PC desktop suite if you're more comfortable handling your phone management via USB. Above all, Airdroid's 'Intruder' feature is interesting. It allows you to access your phone and has anti-theft protocols, much like Google's Android phone manager. However, its intruder feature takes it to a different level. If a person tries to enter a locked phone and fails, it uses the front-view camera to take a photograph of the intruder and sends it to the owner. Simple and effective.

Installing Airdroid involves a certain amount of work. You need to have both your PC and the Android device at hand. On the PC, go to <http://www.airdroid.com/> and register with your Google, Facebook or Twitter account. If you have neither, use any email account. Meanwhile, download Airdroid from the Google Play Store on your device. If you prefer QR codes, go to <http://v2.airdroid.com/> and scan the QR code to do the same. Once you've made your account, sign in to it from your PC and device. In a few minutes – Voila! Airdroid is active. Go crazy.

Airdroid User Interface on a web browser

Files Drag and Drop

No, that heading isn't just an instruction. It's also the name of an app that does exactly that – drags and drops files onto your Android device from your PC. Drawing from the use of apps like File Drop, this app makes it easier for people who occasionally transfer files to and from their phones, with no need for

confusing instructions about file managers and so on. It comes in handy for people whose usage of file transfer mechanisms is limited to transferring that one song or that one folder onto their device once in a while. This kind of file transfer happens over Wi-Fi where the PC and the Android device are both on the same network.

To install, download the Files Drag and Drop app from the Google Play Store. At the same time, download and install its PC counterpart from <http://www.filesdnd.com/> download once installed, run both programs. Select 'Start the Service' on your device, and it will show up as a device on your PC. Drag and drop files onto the device icon to transfer them. Note: Both devices need to be on the same network for this to work.

To be perfectly honest, all software that deal with managing your Android device more or less do the same thing. Something which you would have noticed in this article. The trick in doing it right is picking the right software to suit your own personal needs, and (possibly more importantly) picking the software that you as an Android owner are most comfortable using. Comfort is an important part of micromanagement. It's like choosing the right guitar. The right one just feels right in your hand – so our advice of the month to you is this: try what we've mentioned, and settle on the one that feels right. 

Files Drag and Drop
