

## Intel opens up

Intel CEO Brian Krzanich mentions about plans to allow others to use its chip making facilities <http://dgit.in/1cMtzd1>

## Modular Moto

Motorola to pair up with 3D Systems for "Project Ara" a modular phone system <http://dgit.in/1ewNbUB>

## Phone slowing down...

Dear Agent 001,

My father has a Samsung Galaxy Ace GT-S5830. It has been more than one and a half year since he bought it but now the phone is very slow in all aspects. He doesn't wish to change the phone, yet he is not satisfied with its performance. What can be done so that the phone works as it used to when it was bought? The specifications of the phone are as follows:

- Model number: GT-S5830
- Android version: 2.3.6
- Build number: GINGERBREAD.DDKQ8

Note: I have once updated the system myself....

Please help..

–Jayashankar Jayan

**A** Have you ever factory reset the phone? If you have downloaded a lot of apps, have a lot of WhatsApp, SMS or any app data stored on the phone, it tends to slow down. Take a backup of the contacts and other important data and try factory resetting it (you can do this through the settings options). Hopefully the phone should go

is best according to performance and battery life between Canvas Magnus a117 and Canvas 4. Please suggest me the best phone with best performance within my budget which is around 16K. Thanks.

–Chatar Singh

**A** The Micromax Canvas Magnus A117 runs on the MediaTek MT 6589T chipset while the Micromax Canvas 4 on the 6589. The difference is that the clock speed of the 6589T is higher than the 6589. The performance of both the smartphones is good and the difference isn't much from a real world usage perspective. The Magnus is cheaper and has lower built-in storage when compared to the Canvas 4. If the built in storage is a deal breaker, then go in for the Canvas 4. If not, then you can consider the Magnus. Hope this helps.

## Smart car audio solution

Read an article on Thinkdigit that spoke about integrating an old smartphone/tablet into the existing audio system within a car. I was actually thinking about doing that. But the problem is that my car has

Memory card

phone/tablet to the speakers installed in the car. However, if there is a good accessory installation person close to where you live, we suggest speaking with him once. He may be able to offer a pass-through solution, either via an interface, or even through another aux-in setup.

## Memory card crash

Yesterday my smartphone's 8GB memory card suddenly crashed after I rebooted it – never thought that would ever happen. Anyway, the mobile phone in its current state does not read or gives me any access to the memory card and tells me that the memory card is corrupted or damaged. It tells me to format the memory card... which I do not wish to as I have a lot of personal data on it. The card has nearly 3GB worth of files on it. What to do? Please help

–A Digit Reader

Factory reset

back to its original performance. In future, always checked cached data for our most-used apps, and regularly keep deleting it from the system settings.

## Which Micromax smart-phone to buy?

Dear Agent, Please tell me which phone

an old cassette player which doesn't work anymore. Is it possible to add a male 3.5 mm jack to the speakers, thus completely overriding the cassette player?

–Prashant Bharadwaj

**A** I don't think there is an interface that allows you to directly plug in a smart-

**A** Don't panic, follow these instructions carefully and see if they work. Put the card into a laptop and see if it reads on the laptop. If you get the same error messages for the card on the laptop, then you will be forced to format. Immediately after you format, do NOT write any data to it, instead get Recuva (piriform) and search the memory card using a deep search in Recuva. This should recover most of your files.

Make sure you DO NOT format the card on the phone, and make sure you have installed Recuva BEFORE formatting on the laptop. Also remember to recover data to the laptop, and not to the memory card itself. **d**
