Ups and Downs in the Gadget World

It's a bumpy era, this techno-rollercoaster we're on

Fujifilm enters the Indian MILC market

Fujifilm India has finally announced the release of its latest mirrorless camera, the Fujifilm X-A1 and a professional grade prime lens, the Fujinon XF23mm f/1.4. The camera is aimed at enthusiasts looking to upgrade from their Point-and-Shoots and move towards a more professional shooting experience without breaking the bank.

The Fujifilm X-A1 comes with a 16MP CMOS sensor and is the first mirrorless camera from the company to not have an X-Trans sensor. However, it still retains the EXR II image processor found in the newer high-end Fujifilm cameras which, according to Fujifilm, allows it to operate at quicker speeds; for instance it reduces the start-up time. The X-A1 also comes with a number of special

in-camera effects, including Toy Camera, Miniature, Pop Colour, High Key, Low Key, Dynamic Tone, Soft Focus and Partial Colour (Red/Orange/Yellow/Green/Blue/Purple). The camera also offers a Multiple Exposure mode which allows you to superimpose a second exposure onto the first exposure for a more creative touch. While the creative modes might appeal to the novice audience, Fujifilm has also included the five Film Simulation modes it's known for, namely; Provia, Astia, Velvia, Monochrome and Sepia.

Along with the Fujifilm X-A1, the company has also introduced its latest prime lens in the market - the Fujinon XF23mm f/1.4 R. The lens has a solid metal construction with an aperture ring around the lens barrel, and feels as premium as any other Fujifilm lens in the past. The lens also comes with

a distance scale etched into the body just in front of the manual focus ring, but doesn't include an IR adjustment marking. On a Fujifilm mirrorless camera, the lens offers an effective focal length of 35 mm and coupled with the seven-blade aperture, also offers a very pleasing bokeh effect.

The Fujifilm X-A1 and the Fujinon XF23mm f/1.4R are both available across select stores for ₹44,990 (kit) and ₹66,999, respectively.

Sony PS4: Not so perfect, after all?

The Sony PS4 crossed the million sales mark in North America within the first 24 hours of being put on sale despite several reported issues.

In most of the cases, the cause of the problem seemed to be the HDMI jack. Video game-focused blog Kotaku reported that it was able to isolate the issue to the HDMI connection.

THE FIX: Press the metal piece down a little so that it is no longer sticking up (please make sure you do this very, very carefully). The cause of the problem seems to be a manufacturing issue.

Among the complaints received were a few regarding the PS4's DualShock 4 controllers not being bundled with an accompanying charging USB cord, the new console booting up with the 'Blue light of death' (BLOD) and the console being DOA or dead while still being

SONY RESPONDS:

"A handful of people have reported issues with their PlayStation 4 systems," a Sony spokesperson told Mashable. "This is within our expectations for a new product introduction, and the vast majority of PS4 feedback has been overwhelmingly positive. We are closely monitoring for additional reports, but we think these are isolated incidents."

in use. At the time of writing, out of a total of 2,107 customer reviews, 591 customers gave it a single star rating, mostly related to the BLOD issue, which means that over 28% of users are facing issues with their new consoles.

This might not be the start that Sony, the company that won the hearts of gamers with its pre-launch marketing campaign, would have hoped for. We hope Sony can fix the issue before its India launch.

HCL shuts PC manufacturing

HCL will no longer be manufacturing PCs, but will continue to remain in PC distribution and after-sales services. It had started to take a toll on the PC maker, who's already been exploring new avenues with tablets and ultrabooks.

HCL Infosystems CEO and Managing Director Harsh Chitale is quoted as saying, "On possibilities of job cuts, Chitale points out less than
