

Instagram on Windows Phone

Instagram has finally made its much awaited appearance on Windows Phone platform, with no direct in-app camera support

**SkyDrive for iPhone update**

Microsoft has updated its SkyDrive for iOS app that automatically uploads camera pics to their SkyDrive cloud storage

The only thing constant on the web is change

And this month there have been some big predictions for its future and some initiatives that put the web at the center of social change

Web censorship to end within a decade

Google's Executive Chairman Eric Schmidt has predicted the end of censorship around the world in a decade. He added that better use of encryption will help people overcome government surveillance. Eric Schmidt made the statement during a talk titled "Connecting with the World: Empowering Young Entrepreneurs for the New Digital Age" at the Chinese University of Hong Kong on November 4, 2013.

Schmidt has long spoken out against limitations to the freedom of expression and restricted Internet access around the world. He recently even travelled to North Korea to support the cause.

"First they try to block you; second, they try to infiltrate you; and third, you win. I really think that's how it works. Because the power is shifted," he said. "I believe there's a real chance that we can eliminate censorship and the possibility of censorship in a decade", he said.

He stated that the people needed to connect with the rest

of the world: "My view is that if we can get some connectivity, then they'll begin to open the country, they'll begin to understand other systems."

Google has long been working on encrypting data to protect users' privacy. Schmidt stated that Google has recently increased the length and complexity of its encryption keys, and called it a constant "game of cat and mouse" between the government surveillance and internet users.

Recently, Yahoo! CEO Marissa Mayer also announced that the company would encrypt all its internal server traffic by the end of Q1 2014. Mayer stated in a blog post that the company would make Yahoo! Mail even more secure by introducing HTTPS (SSL - Secure Sockets Layer) encryption with a 2048-bit key across its network by January 8, 2014. She added that the encryption would be applied across all Yahoo products as well as mail partners.

Another prediction that puts India in the lead

eMarketer predicts that India will surpass US by 2016 to become the world's largest Facebook population. The research firm based this prediction on India's current statistic of recording the highest social networking growth - an increase of 37.3 percent - this year.

We the people!

Indonesia followed India with a growth of 28.7 percent with Mexico trailing behind with 21.1 percent. The report added that the growth in developed countries has stagnated due to saturation.

All of these three countries are high-growth areas for Facebook, and eMarketer estimates that they'll reach a worldwide monthly user base of 1.026 billion this year combined. US still has the greatest number of Facebook users, with 146.8 million this year. But eMarketer believes that India's large population and high expected growth rate will lead the country to have the largest Facebook population of any country in the world by 2016. Nearly 1.61 billion people are estimated to log in to social networks at least monthly, from various electronic devices.

The report added that there has been a growth of 14.2

percent in social networker numbers from 2012, and the double-digit growth is expected to continue for another year. The research also found that by 2017, 2.33 billion people will use social networks.

According to a recent report by IAMAI, India will become the world's second largest Internet population with nearly 243 million users by June 2014. India currently has 205 million active users, US has 207 million users and China retains the No.1 spot with 300 million internet users.

More predictions: Indian entrepreneurs can build the next Google

Google's Eric Schmidt states that India's entrepreneurial innovators have the potential to build the 'next Google' if the country 'plays its cards right' and ensures internet access for
