Apps that add to your experience behind the wheel

Driving isn't all about the throttle, the gearshifts and turning the steering wheel. We list a few apps that add to the entire experience, with more information at your disposal

Vishal Mathur

vishal.mathur@thinkdigit.com

Driving isn't just a boring activity of sitting down and turning the wheel in hopefully the right direction. If you have the correct smartphone, and the right apps to go with it, the experience is amplified. To help you get going, here's a selection of Android and iOS apps that offer some exciting alternate angles to the experience. But, with any such app that uses GPS connectivity, be aware that the phone will heat up considerably more than usual.

is approaching. Doesn't need any additional gadgets or accessories to be installed in your car. Build a route in advance, and once it's saved on the device, you don't need web connectivity for it to work. Set the route, place the iPhone on the dashboard and the projection shows up on the windscreen. While we're

not huge fans of anyone blindly following a navigation service while driving, this is one must-have app, particularly in winters as an add-on to your instincts.

Not an app meant for everyone, because while it's free to download, only the connoisseurs will. Also, the projected heads-up isn't very visible in bright sunlight, and is mostly meant for low visibility and low light conditions.

DriveSafe.ly

Platform: BlackBerry, Android
Price: Free (₹870 per year for Pro version)

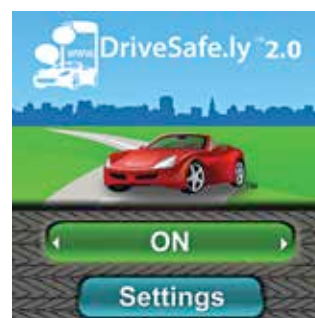

We've been using this app for quite some time now, and it's one of the old favorites. Not everyone has an infotainment system in the car that also

offers complete bluetooth connectivity and SMS readouts. Yes, Ford Sync, we envy you! For the poorer mortals among us, we have to make do with apps! And DriveSafe.ly keeps it rather simple. You just need to switch on the app's reader feature, and the service will run in the background. The moment a new SMS arrives, the reader will...um...read the contents, including the sender's name or contact number. The phone's built-in handsfree speaker is used for this, and no additional accessory or set-up is needed. While the basic app is free to download and use, the Pro version adds things like optional text message auto-responder, choice of female or male voice and auto-select voice by contact gender.

Ulysse Speedometer

Platform: BlackBerry, Android
Price: Free (₹69 for ad-free version on Android)

This is the multi-tasker among the apps mentioned here that provides quite a few options relevant to the drivers.

Ulysse Speedometer gives you a GPS-assisted speedometer, which will be more accurate than the factory fitted speedometer in your car, which always has variations and errors. The app will notify you (if you want it to), every time you cross the speed limit in a particular region. Multiple trip settings and the latest version

also adds the ability to access the phone dialer and contacts from within the app – providing quicker access while you may be at the wheel. There is our old favorite, an HUD mode as well, that projects the speed on the windscreen, but really usable only after the sun has gone down. The pro mode for Android costs ₹69, and removes the irritating adverts. We would suggest paying that, and experiencing the app in its full glory. **[1]**
