

◀ **ENTRY  
LEVEL DSLR:**  
**NIKON D5200**  
Price: ₹38,000

Many assume that since Canon had to issue a recall on several EOS 650D units due to faulty grips, the camera garnered a negative image and the EOS 700D is an attempt to move on from that tarnished image. The inside is identical to the 650D, but the outside is better. The touchscreen is as responsive as any high-end smartphone, but doesn't really add any value as such to your images.

## Semi-Pro DSLR

Last year was actually a better year for dSLRs than 2013. We saw more powerful models introduced in 2012 – Canon EOS 5D MarkIII, Nikon D800, the Canon 1DX and the Nikon D4. While the entry-level segments saw their updates coming in like clockwork, the only expected release everyone hoped for was that of the Canon 7D MarkII. Unfortunately, many were left disappointed. The focus this year seemed to be advanced point-and-shoot and mirrorless cameras, but that didn't stop Nikon and Canon from releasing two new semiprofessional dSLRs this year. Both cameras are quite a step up from their predecessors and if you're in the market for a new camera, we strongly recommend stretching your budget to get either of these two.

### Zero1 Winner Canon EOS 70D

Back when the EOS 60D was introduced, it was carefully designed to not step on the 7D's turf. The 7D was at the time heralded as a mini 1D series camera and the 60D thus ended up feeling some-

what underwhelming. The Canon EOS 70D comes out to fix that and then some. The EOS 70D packs the first of its kind Dual Pixel AF CMOS sensor, which allows the camera to achieve near silent AF during Live View and filming mode. Its incredibly effective when paired up with an STM lens or the higher end USM lenses for a much better video shooting experience. The camera also packs the familiar touchscreen from the EOS 700D which adds to its versatility. The best aspect, however, happens to be the fact that the EOS 70D has inherited the EOS 7D's AF system in all its 19-cross-type AF point glory. The EOS 70D impressed us in every test we threw its way – even managing some pretty neat images at high ISOs. If you venture into low light with this camera, you will not be disappointed. In fact, if you buy this camera for anything, you won't be disappointed. Just don't try to shoot F1 races with it.

### Worthy mention Nikon D7100

The Nikon D90 was a revolutionary camera for its time and segment, one that lived through the product cycle of the D7000, a camera that was supposed to replace the former. The D7000, unfortunately ended up being quite an underwhelming camera and those who had been long waiting for the update to the D90 were left a little too disappointed. Nikon's had its ear very close to the forums and out came the D7100. The D7100 is one hell of a robust camera that screams "serious chops" the minute you pick it up from the box. It has a 51 point AF system with 15 cross type, offering an adequate area of coverage. It tracks focus brilliantly, and maintains its potency even in low light. If you've been considering an upgrade for your Nikon camera, just go out and buy the D7100 with your eyes closed.
