

PROJECT ANARCHY

GAME DEVELOPMENT WITH PROJECT ANARCHY

Gaming has come a long way since the days when we used to play games like Mario and Contra. Today the gaming experience is more sophisticated with detailed visuals, better physics and most importantly the AI that has significantly improved over the ages to provide a much more engaging experience to the player. Moreover, the emergence of mobile gaming is one of the factors that has significantly changed the way games are played today, specifically on handheld devices. This has resulted in the need for game engines that offer developers the possibility of deploying the game to multiple platforms and devices without having to reinvent the wheel for each new device and architecture that they want to target.

Project Anarchy (<http://www.projectanarchy.com>) is one such collection of game development tools that allows all kinds of developers to target and publish games on Android*, iOS* and Tizen* platforms and the best part is that it is available for free. It has been developed by Havok, a leading name in game development, most famous for its physics engine which has been used by most major AAA releases in the industry. Project Anarchy brings all this gaming goodness and experience to the fingertips of budding game developers for free.

So what's the catch? Well not much really. All Havok asks of you is to agree to the following conditions:

- You are encouraged to be a part of the community and help make the product better by participating on its website which has all sorts of opportunities to interact with other developers in the form of forums, Q&A etc.

GAME ENGINES OF TODAY NEED TO OFFER DEVELOPERS THE POSSIBILITY OF DEPLOYING THE GAME TO MULTIPLE PLATFORMS AND DEVICES WITHOUT HAVING TO REINVENT THE WHEEL FOR EACH NEW DEVICE AND ARCHITECTURE

- Havok requires you to agree to some a bit of co-marketing that it might want to engage in when your game is published. Specifically, this means that you are required to have a Project Anarchy splash screen before your game is launched and the possibility for Havok to do some kind of promotion activity when your game is launched.
- If the game is being published on an official app store like Google Play and the platform supports an x86 compatible version of the game, then you are also required to build and publish the x86 binary for the same.

These three conditions are the only applicable for the free license applicable when you are releasing games on the mobile platform. This standard license bundles along with it all products such as Havok Vision, Physics, AI and the Animation Studio. In case you want to customize and tweak the engine according to your needs, headers for all products and source code for the integrations of Physics, AI, Animation in Havok Vision are also available. This license comes with community support and allows you to publish to all the official app stores of the three supported mobile platforms. It also includes a development only license for targeting your games to Windows* PCs. However, if you want to ship games on Windows*, you can purchase the PC exporter license which comes at the cost of \$499 per person in your development team. To make it more clear, the PC exporter license lets you publish games for the Windows* platform, while the free license only lets you develop and run them in the IDE for the Windows* platform. The PC exporter license is expected to be available starting Q1 in 2014 and it brings you the full feature set for targeting your games on Windows*, along with community support similar to the free license. Additionally, a full engine license is also available for incorporated companies which are specifically trying to target more platforms like consoles and comes with official support directly from Havok along with more advanced features like full source code and advanced rendering. All info about licensing and downloads available here: <http://havok.com/>

The components included in Project Anarchy include the Havok Vision Engine,
