

Successful Build Completion for the Android\* project

**Win32\_VS2010\_anarchy\_DX9\_C#:** Solutions only contain C# projects, which is useful for Visual Studio Express users

**Win32\_VS2010\_anarchy\_DX9\_C++:** Solutions only contain C++ projects, which is useful for Visual Studio Express users

During this tutorial we will be using the sample solutions which are present at the following paths:

Android\*\_VS2010\_anarchy\HavokVision\_Samples\_Android\*\_VS2010\_anarchy

Win32\_VS2010\_anarchy\_DX9\_C++\  
HavokVision\_Samples\_Win32\_VS2010\_anarchy\_DX9

There are two build configurations in which these projects can be built:

**Debug:** This is the default option and Debug information is included for the compiled library or executable.

**Dev:** This is the release version. No debug information is included and the libraries/executables are optimized for better performance.

To start the build in Visual studio, follow the below mentioned steps: -

1. Run Visual C++ 2010 Express and open the Anarchy Android\* solution file.
2. On the VC++ Start Page, click Open Project...
3. Navigate to your AnarchySDK\Workspace\Android\*\_ARM\*\_VS2010\_anarchy\_\_C++ directory and select HavokVision\_All\_Android\*\_VS2010\_anarchy.sln.
4. In the Solution Explorer on the left, you should see a list of projects. Right click on one of the samples e.g. **MobileOffRoad** and select **Set as StartUp Project** from the context menu.
5. Set the build configuration to **Dev** and Press F7 to start building. This may take a while. Once the build process is finished, the RPG sample will be automatically installed and available on your Android\* device.

In case you get installation errors during the build process, ensure that you have appropriate space on the device and that the game has not been installed on the device already. You can also try installing the game manually. The generated

apk files are located in bin\Android\*\_vs2010\_anarchy in the Anarchy SDK directory. You will again find two directories, one for the debug configuration and one for the dev configuration. These can be installed as follows: -

- Locate the apk. It should be located in your Anarchy SDK directory under: bin\

**REGISTRATION WILL ALLOW YOU TO PARTICIPATE IN DISCUSSIONS, QUESTIONS/ ANSWERS AND LET YOU SUBMIT FEEDBACK AND IDEAS ON THE PROJECT ANARCHY WEBSITE**

Android\*\_vs2010\_anarchy\Dev\libMobileOffroad\_and-vs2010\_anarchy\_dev

- Open the Command prompt.
- Execute: adb install <Anarchy SDK path>\bin\Android\*\_vs2010\_anarchy\Dev\libMobileOffroad\_and-vs2010\_anarchy\_dev

## COMPILING AND RUNNING THE WINDOWS\* SAMPLE

To compile and run the Windows\* version of the sample, load the appropriate sample in the Solution explorer and set the build configuration to **Debug**. Right click on the project and choose the **Set as StartUp Project** option. You can now start building using the Build option in the context menu. Once the build is complete, ensure that vForge is running and if it is not, it can be started via **Start Menu > All Programs > Havok Project Anarchy > Tools**. Once it is up and running, you can click on Start Debugging and you should be able to see the game in all its glory.
