

Mystery in Berk

The new 'How to Train your Dragon' trailer unveils the mystery character behind the mask. Find out who it is: <http://dgit.in/httydrag2>

Depp Transcends

Take a look at the trailer of Johnny Depp's new film 'Transcendence' which is raising quite a few eyebrows in curiosity. <http://dgit.in/D3pptrans>

Squeaky Clean

How to prepare for and perform a clean install of Windows efficiently

Prakrit Dhondiyal

readersletters@thinkdigit.com

Remember the sweet plastic smell of your freshly unpacked computer? How it smoothly turned on, and seamlessly took you to your gloriously plain desktop? Not that it's necessarily a worthless piece of junk now, but power users who crack software and generally experiment with new and innovative uses of software end up visiting hundreds of infected web pages which inadvertently infect their own PCs no matter how protected or careful they are. Even if you don't live on the edge, years of bloat start showing sometime down the line.

What you need, on occasion, is a reset button that takes your PC back to a state when it was on its best behaviour.

Clean installs are almost a must for those who like keeping their systems smooth and infection-free – much like one would do a regular tune-up of their vehicles – to keep the bugs and glitches away. We obviously don't recommend a monthly full system clean-up, but once a year or every few years, "just to be safe" isn't a bad thing to plan for. All you need to do is back up all that data and do a clean install of Windows. Here are some things to keep in mind before you do either.

Back up your data

Unless you're one of those obsessive compulsive techies who arranges his stuff meticulously down to the last .txt file, your data is probably all over the place, in folders labelled 'to sort out' and 'more stuff to sort' or maybe in Leet codes and hidden directories among your system files. And unless you have

Storage for back up!

an eidetic memory, it's more than likely that you'll miss one of these 'important folders'. Think hard, and remember to back up your data, especially little things such as saved passwords, auto-fill data from browsers, Windows sticky notes (yes there's a way to back that up as well. Read further and see our checklist to know more), etc.

Use System Restore Points

Windows System Restore points are meant to be used in case of extreme situations. However, don't avoid the feature either; use it well.

To create a system restore point, go to Control Panel > System > click 'System Protection' on the left-hand side pane > System Restore. You may need Administrator permission for which you may need a password. Enter this and then click on 'Create'. On the System Protection dialog box that pops up, type out a description to make it easier for you to find the restore point, and then click 'Create'. To restore this point

in the future, run the 'System Restore' option on the same tab and select your saved point.

The System Restore option usually comes in handy at times when you accidentally install software that starts playing havoc with your PC, or refuses to uninstall because of corrupt files. The option leaves your files and folders intact, so now worries. All the drivers installed at the time the restore point was set will also stay where they're supposed to be.

Important milestone: Windows system restore point

Clonezilla

Too lazy to pick out your folders and save the necessary ones? Clonezilla to the rescue! It's a software for people who are ready to prepare themselves for a probable crash. Sure, you can do a clean boot and reinstall Windows, taking away any and every system problem you may have with your PC. But at the end of the day, you'd obviously prefer a clean system with all the essential and basic software intact. To do so, follow the instructions given below.

Download the compatible Clonezilla .iso file from <http://dgit.in/cloneZilla> and Tuxboot from <http://dgit.in/tuxboot>. When downloaded, use Tuxboot to create a bootable Clonezilla USB with the Clonezilla ISO. When done, restart your system, and enter System BIOS. In BIOS, switch your boot order to boot from the USB before the default hard drive. Remember to save changes and exit. When you reboot, Clonezilla will start. Follow the instructions and create an image of your primary partition. For the sake of safety, store this image in
