

XCOM coming to Android

XCOM: Enemy Unknown, the popular turn-based strategy game from 2KGames will be available for Android soon. <http://dgit.in/DroidXCOM>

Flash Trek

The new Flash Gordon remake shall be written by three Star Trek writers. Read on to know more <http://dgit.in/flshtrek>

two more folders but you only need to use them if you have coded your application in such a manner that breaks down your code as platform specific and platform independent. In this case all platform specific files are stored in the “platforms” folder with each platform having their own folder at the same level (ios, android, bada, etc.).

Step 5 - Create the manifest

In the root directory of your app you'll need to provide a config.xml file with all the parameters about your app. This includes the name of the app, the different permissions that you'll need on each platform, core plugins, third-party plugins, icons and splash screens for each platform. If you've included third-party plugins which require an authentication key of any sort then you'll get an example code which you'll have to include in the xml code. Don't worry though, if you don't make the xml file on your own then the build service will do it for you but all the plugins won't work and all the icons will be replaced with the standard PhoneGap icons.

Step 6 - Zip it up!

Finally, you just have to compress your folder using zip compression and no encryption. The config.xml file ensures that all the necessary permissions are included with your application when it is compiled. This is the package you'll need

The errors indicate that no signing key have been provided for those stores

to upload to the PhoneGap build web site or you can commit the files via github.

Step 7 - Upload

Visit <https://build.phonegap.com/> and sign up for an account. If you use Github for your sign in then you can upload your project folder to Github and have new builds generated as soon as you modify any file. This process is not automated since this Build service is provided free of cost. If you were wondering about the signing keys for

each platform then you need to add them to your <https://build.phonegap.com/> account. Otherwise your application package will not be generated for that particular platform. Even if it is generated you still won't be able to upload these files to the appropriate app store. In the image below you can see that only two packages are generated, the rest aren't either because a signing key was not provided or the PhoneGap version selected for the build is incompatible with the said platform.

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- config.xml reference: https://build.phonegap.com/docs/config-xml -->
<widget xmlns=""
  xmlns:gap="http://phonegap.com/ns/1.0"
  id=""
  version=""
  >
  <name>Digit Test</name>
  <description>Testing out PhoneGap</description>
  <author>Secret sauce</author>
  <reference name="phonegap-version" value="3.3.0" />
  <reference name="orientation" value="default" />
  <reference name="target-device" value="universal" />
  <reference name="fullscreen" value="true" />
  <!-- Plugins -->
  <gap:plugin name="com.phonegap.plugins.facebookconnect" version="0.4.0">
    <param name="APP_ID" value="DIGIT" />
    <param name="APP_NAME" value="digitapp" />
  </gap:plugin>
  <!-- Core plugins -->
  <gap:plugin name="org.apache.cordova.battery-status" />
  <gap:plugin name="org.apache.cordova.camera" />
  <gap:plugin name="org.apache.cordova.media-capture" />
  <gap:plugin name="org.apache.cordova.console" />
  <!-- Define app icon for each platform. -->
  <icon src="icon.png" />
  <icon src="res/icon/android/icon-36-ldpi.png" gap:platform="android" gap:density="ldpi" />
  <icon src="res/icon/android/icon-48-mdpi.png" gap:platform="android" gap:density="mdpi" />
  <icon src="res/icon/android/icon-72-hdpi.png" gap:platform="android" gap:density="hdpi" />
  <icon src="res/icon/android/icon-96-xhdpi.png" gap:platform="android" gap:density="xhdpi" />
  <!-- Define app splash screen for each platform. -->
  <gap:splash src="res/screen/android/screen-ldpi-portrait.png" gap:platform="android" gap:density="ldpi" />
  <gap:splash src="res/screen/android/screen-mdpi-portrait.png" gap:platform="android" gap:density="mdpi" />
  <gap:splash src="res/screen/android/screen-hdpi-portrait.png" gap:platform="android" gap:density="hdpi" />
  <gap:splash src="res/screen/android/screen-xhdpi-portrait.png" gap:platform="android" gap:density="xhdpi" />
  <access origin="*" />
</widget>
```

The config.xml lists all the plugins, icons, splash screens, app name, etc.

Step 8 - Test your app

If you have a developer account then you can test your app out on your iOS device, for android devices you need not worry about having a developer account. Simply enable application installation from “Unknown Sources” in your Android device's security settings and you can install your app by transferring the apk file to your device and then tapping on the file using any file browser.

Step 9 - Upload to the store

Once you have tested all the apps and are satisfied with it you may proceed towards uploading it to each store. If you are submitting an app for the first time then the review process will take about 24-48 hours after which you can find your app on the respective app store.
