

## Sony Pictures hacked

Sony Pictures has been hacked by a group which calls itself #GOP after one of its server was compromised <http://dgit.in/SonyPicHack>

### Let's talk about mbed OS vs. Android. Is mbed OS designed to compete against Android in the IoT segment?

**Guru Ganesan:** A. Yes. In the embedded segment, we need a better designed OS with a focus on power consumption and mbed OS is that solution. Most devices in this segment already run on ARM processors and the mbed OS should further help our partners to make better devices.

IoT is itself an evolving segment and it is up to the manufacturers to come together and standardise it while also compete with each other to bring more features into the segment. IoT is a segment that will see a lot of variety in terms of product design and operation so there needs to be some standardization as well.

With mbed OS we are providing a solution for our partners to help them develop products faster.

### In what aspects does mbed OS actually beat Android? Why did ARM develop it?

**Guru Ganesan:** It's too early to say. mbed OS is much more suitable for the segment and we've been developing it internally for quite some time.

While I don't know the exact details about how Android differs from mbed OS, our solution is a natural fit especially since our hardware already powers a lot of embedded devices and therefore is an extension.

### Where does India stand in terms of ARM's global operations?

**Guru Ganesan:** So, India has ARM's second largest design center in the world after our headquarters in Cambridge. ARM is not a huge company but the kind of impact we have on the industry makes people think we are a 30,000+ company but in truth, globally, we only have about 3,000 employees out of which about 400 to 500 work in India. We have a lot of talent in India and we also attract a lot of the folks who left India about 15 to 20 years ago, who end up coming back to the country to work with us.

### What is the roadmap ahead for the ARM v8 64-bit SOC?

**Guru Ganesan:** We have been developing the 64-bit architecture since 2007. And since then we have managed to license it out to many of our partners and have gained a lot of traction in both the enterprise and (now) smartphone markets.

We have full confidence in our partners and that they will see the segment forward.
