

OS X YOSEMITE

Make an OS X Yosemite installation disk

Since the Mac App Store was introduced, all the OS releases and updates have been directed through it. This is why – unlike Windows – you don't get a permanent physical copy of the OS release. However, you can create a bootable installation of Yosemite or any other OS X release on a USB drive. This will be helpful in a crisis or while installing the OS on a different Mac without downloading the huge 5GB package again.

You need a USB flash drive (a pen drive) with 8GB minimum storage. Download OS X Yosemite from Mac App Store and make sure you complete this process before proceeding with the installation as the system deletes the downloaded installation files after you've installed the new update.

Firstly, format the drive with 'Mac OS Extended (Journaled)' file system and name it 'Untitled'. Open the terminal and type the following:

```
sudo /Applications/Install\ OS\ X\ Yosemite.app/Contents/Resources/createinstallmedia --volume /Volumes/Untitled --applicationpath /Applications/Install\ OS\ X\ Yosemite.app --nointeraction
```

Then press [Return]. The process will continue after you type in the administrator password. It will take around 20-30 minutes for completion.

Selectively mute message threads

Like with iOS, you can selectively mute message threads on your Mac. This feature comes in handy if you're getting annoying messages from someone you don't want to hear from. To selectively mute message threads,

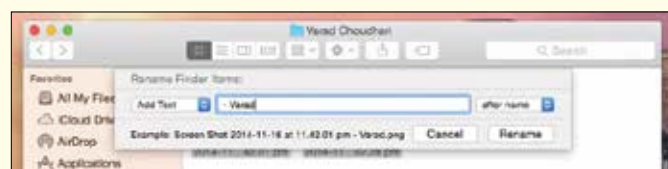

OS X Yosemite.....	54
Enhance browsing on Firefox.....	55
Mastering Outlook.....	57
Evernote	61

{ Tips & Tricks has its own page numbers, and does not follow the rest of the magazine's page numbers. This is done to ensure that you can cut out and save T&T in a separate folder for later reference. }

open Messages app. Select the thread you want to mute -> Details -> Check 'Do not Disturb'.

Rename multiple files at once

Mavericks offered a batch-renaming feature, however,

Add text to append at the start or the end of the file

Yosemite takes it to a whole new level. Select the batch of files you want to rename -> Right-click -> Select 'Rename (x) items'. You can rename it in three ways: Replace Text, Add Text and Format.

Replace Text works just like traditional Find and Replace, where you can find the text present in the file name and replace it with another name. Add Text appends the current file name(s) with the one you specify. Format lets you completely change the

name by choosing a specific format of file name(s).

Try the new Dark Mode

With Yosemite, you can change the color of the menu bar and dock to a darker shade with a black tint. To do it, go to System Preferences -> General

-> Check 'Use dark menu bar and dock' located under Appearance.

Share screen in Messages app

You can share your screen with a friend or a client while chatting using iMessage. Some prerequisites for this to work:

- Both users must be running Yosemite,
- Both users must be signed into iMessages
- A text conversation must have been started, otherwise the

needed button doesn't appear. To share your screen, initiate a text conversation -> Click on 'Details' -> Tap the double-screen icon -> Choose whether you want to share your screen or see theirs.

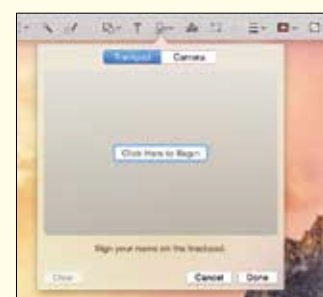

Record your iOS device screen using QuickTime

Yosemite allows you to record your iOS device screen using QuickTime. This feature is aimed at developers who want to make video demos of their app. To use this feature, your iOS device needs to be updated to iOS 8. Also, this recording feature doesn't work with old devices that have a 30-pin dock connector. This is where it pays off to own an iOS device with a Lightning Connector.

To record the screen, connect your device to your Mac using the Lightning cable and unlock your device. Launch the QuickTime Player on your Mac -> Go to File Menu -> Select 'New Movie Recording' -> Click on the small arrow next to the red recording button -> Select your iPhone -> Hit the recording button to start recording.

Create signatures using Trackpad

With Trackpad you can now input your signatures as well, and it works flawlessly. To do it,

Select Trackpad, hit the begin button and sign
