

and distributed as part of a free Open Source project by the Mozilla Foundation. Firefox has gained ground over the past few years due to its customability and light-weight nature. In this section, we'll follow the same route as we did for the Chrome section and list a few general tips followed by tweaks in the browser configuration to enhance performance and usability.

Use a keyword to search within a site

This trick bypasses the process of opening a website to search within it; the hack simply condenses it into a single search from Firefox's address bar, also called the 'Awesome Bar'. Open any website with a search bar (E.g. www.amazon.in) -> Right-click on search bar -> Add a keyword for this search. In the tab that opens, enter 'amazon' as the keyword. Now if you want to search for an external hard disk on amazon.in, instead of opening the website and using its search bar, you can simply type your query along with the keyword - 'amazon external

Preference Name	Status	Type	Value
app.update.enabled	user set	boolean	true
app.update.mode	default	integer	3
app.update.interval	default	integer	172800
app.update.service.enabled	default	boolean	true
app.update.background	default	boolean	false
app.update.alert	default	boolean	false
app.update.auto	default	boolean	true
app.update.interval	default	integer	120
app.update.url	default	string	https://www.mozilla.org/update/3/PRODUCTS/VERSIONS/NEW_B/NEW_B/TARGETS/LOCAL...
app.update.details	default	string	https://www.mozilla.org/UPDATE/3/PRODUCTS/VERSIONS/NEW_B/NEW_B/TARGETS/LOCAL...
app.update.details	default	string	https://www.mozilla.org/UPDATE/3/PRODUCTS/VERSIONS/NEW_B/NEW_B/TARGETS/LOCAL...
application.cache.enabled	default	boolean	false
application.cache.enabled	default	integer	0

Mess with tonnes of options in the about-config page

from the website. In this way, you can search for a query in any non-Google search engine or website with a dedicated search bar, similar to the Omnibox's 'add a new search engine' feature in Chrome.

Discover Easter Eggs

Firefox has an awesome group of developers, which is most evident by the sheer ingenuity of the Easter eggs hidden in the browser. Check out the 'about:robots' page (Type 'about:robots' in the Awesome Bar). It actually has references to pop culture usage of robot-themed media and makes a reference to 'The Hitchhiker's Guide to

from what's called 'The Book of Mozilla'. This entire book can be seen here: <https://www.mozilla.org/en-US/book/>. The book supposedly tells the story of Netscape Navigator's battle against Internet Explorer.

Boost UI performance

We briefly spoke about how Chrome's performance could be boosted by using hardware acceleration. On Mozilla, there's a basic provision for doing the same. Go to Settings -> Advanced -> General. Check the boxes next to 'Smooth scrolling' and 'hardware acceleration'. Enabling these options might provide a fractional speedup while browsing graphics-intensive pages.

Change the default email client setting

When you click on 'send mail' links on Firefox or any other browser you're immediately directed to your default mail client such as Outlook (on Windows). Firefox allows you

to change this setting. Simply go to Preference -> Applications -> Search for the content type 'mailto:'. On the right, you can change the action type by selecting from a dropdown list. Using this option, apart from email you can set default applications that the browser can use to open files such as JPEG, MP3, etc.

Use the about:config page

The 'about:config' page is where all the subtle tweaks are done, which if experimented with responsibly could enhance your internet browsing experience. This is the chrome://flags equivalent of Firefox, in which Mozilla has bundled some really brilliant features. We'll first introduce you to a few usability-enhancing tweaks and follow them up with some tips to boost performance. As we mentioned in the context of Chrome, these features are guaranteed to work 100 percent of the time, but at times could prove to be detrimental. However, the features listed below are relatively safe and you can revert to your old settings anytime by using software called 'FireTune' made for Firefox.

Some Easter Eggs await!

hard disk 1 TB', in this case- in the browser's address bar and it will throw up the search results

The Galaxy' and 'Futurama'. The 'about:mozilla' page leads you to a serious looking quote
