

secondary account, go to File > Export > Export as a file in ENEX format > Export. Then, to import these files to your primary account log in to it. Go to File > Import > Evernote Export Files... > Pick the .enex

Set up Two-Step Verification

file you exported in the first step.

If you want to only export notebooks and not the contents of the entire account, go to your secondary account. Right-click on the notebook > Select 'Export Notes...' > Export as a file in ENEX format > Export. Then follow the above method to import these files into your primary account. A pop-up will tell you that data importing was successful and that these notes are placed inside a local notebook called 'Imported Notes'. Here, it will also ask if you want to store the notes in a synchronised notebook (i.e. notebooks that are synced across the web, desktops and phone/tablet apps). Click 'Yes' (if you want to access the notebook on all platforms). Right-click to rename this notebook.

Use Evernote templates

We'll be putting that Import-Export feature to use here again, so hope you were paying attention in the last tip. To

create your own Evernote template, first create a new note and include all the required fields for your template. Once done, export it by right-clicking on the note in the Note Panel. To use the template, simply import it, select the imported template note from the 'Imported Notes' notebook and right-click it. Select 'Move to Notebook' and put it into the right notebook. So, for example, a minute of meeting template will go in a 'Meetings' notebook. Follow the same process for importing others' shared templates that you download.

You can find some here: <http://dgit.in/freestuffherei-come> and many more neatly categorised at KustomNote (dgit.in/somanytemplates)

Alternatively, simply create a template note in a notebook titled 'Templates' and select 'Copy to Notebook' by right-clicking on it. Then, move it into an appropriate notebook.

Secure your notes

Set up Two-Step Verification

Protect your account from unwanted entities accessing your notes by turning on Two-Step Verification. This is especially useful if you store important information about yourself here. In the web version, go to Settings > Security Summary > Two-Step Verification > Enable. You'll see a pop-up warning you of the possibility of losing access to your account should you be unable to provide the verification or backup code along with your password. Click 'Continue' and 'Send Verification Mail' in the subsequent pop-up

box. Back on the Security Summary screen, enter the confirmation code sent to your email address. Click 'Continue' and enter your phone number. Wait for the verification code on your phone. Type the code received in the next screen that pops up. Then enter an alternate phone number and you're done.

Going forward, every time you log in to Evernote with your username and password, a verification code will be sent via text message to the phone number you provided. There's an option to use an Authenticator app instead of a phone number, but we suggest going the phone number route in case you mistakenly delete the app in the future or lose your phone. If, however, you do lose your phone and are worried about someone misusing your data, you can revoke access from Evernote's web version via Settings. Once revoked, the

will show you the entire note without any encryption.

Use collaboration apps & tools

Save recipes in a pleasant and user-friendly UI

The 'Evernote Food' app works beautifully along with Evernote. Any notes saved in the note taking application are swooped up by this nifty app and displayed in an easy-on-the-eye manner. It will suggest recipes for you and let you save meals at restaurants you specify. Whether you're a foodie or not, this is a must-have app. After all, everyone eats, right?

Curate a website using only your notes

Ever look at your notes and wish "Sigh, if only the world could know of how deep a thinker I was." or sought to have a forum where you could have others validate your

Kustom gives you access to hundred of free templates

app will request a password the next time it's launched.

Encrypt your data

You can encrypt part of a note or an entire note using a password. No one will be able to read that text without the password. To encrypt, press [Ctrl] + [Shift] + [X] (for Windows) and ⌘ + ⌘ + [X] (for Mac OS X). Note though that this encryption method only works on desktop versions. Viewing the same note on the web or an app

thoughts? You can auto-publish your Evernote notes – whether they're images, audio or videos/YouTube – to a simple blog powered by them. This lightweight blogging platform, called 'Postachio', includes everything from customisable themes and RSS feeds to built-in Disqus commenting and multimedia support.

To set up the blog, first sign up at <http://postach.io> and authorise the service to access your Evernote account. Then,
