

go to Evernote, create a notebook dedicated to the blog and create a tag called “published”. And you’re done with setting up auto-publish. The next time you compose a note and tag it

map them with ‘MohioMap’ – a web-based app that you can find on the Chrome store at <http://dgit.in/mohio>. Besides laying bare all of the contents of your notebook, it helps you

Signing up on Postachio takes no more than 30 seconds

with “published”, it will automatically upload itself to the blog you created during sign-up. See an example of notes turned into posts at <http://dgit.in/notespostachio>. If you want to preview the post right away, go to Postachio’s dashboard and click the ‘manually sync’ icon to publish post. Alternatively, you can try out Cilantro (www.cilantro.io - formerly Everblog.me), which does the same thing. If you’ve been looking out for a Twitter alternative without the 140-character limit, this is it.

If you’re feeling overwhelmed at the thought of having yet another web property and prefer using one of your existing blogs, you can integrate Evernote with WordPress, Jekyll or Tumblr using BlogWith (<http://blogwith.co/>). Sign up on the site and a new notebook named “BlogWith” is created in Evernote. Any notes you compose in this notebook will be synced to your blog.

Visually map your notes

When we’re brainstorming or need a quick view of the connections between a cluster of variables, what do we do? Many of us resort to mind mapping, don’t we? It’s quick, it’s easy, it does the job. If you’re a visual thinker and want to view your notes the same way, you can visually

rediscover old notes you forgot existed. You can assign tags and edit notes and tags right within the app to clean up and better organise your data. Looking at your notes this way will help you identify patterns and find hidden connections. When you discover a new relationship between notes and if you want to remember it, you can use the ‘Jump between related notes’ tip we discussed before.

Transcribe your audio notes

If you’ve been using Evernote for a while now, you’ll notice that there’s an audio record feature. This option lets you save audio clips of upto 25MB in size (i.e.the maximum size of each note). A great feature when you have only one hand free, say, when the other is holding on to There is, however, no in-built feature to transcribe this audio at the moment. No worries. There’s an app for that. It’s called ‘Voice2Note’ and will convert upto 30 seconds of audio to searchable text. The free version lets you transcribe upto five notes per month. (The pro version will automatically transcribe the note for you.) Register at dgit.in/iheardpeople and authorise it to connect to your Evernote account.

Tweet to your EN

If you’re a frequent Twitter user, this will be helpful to you. With this tip, you’ll be able to tweet directly to your Evernote account, where they’ll become notes. All you have to do is follow @myEN. On following you back, it will DM you a link, which you’ll use to connect your Twitter account to Evernote. That’s it. The next time you want to upload a note, simply direct message @myEN the note. If you want to send yourself a note *and* make it public, include @myEN when updating your Twitter status as usual. To retweet others’ tweets – say, customer service interactions to follow up on – as notes, simply retweet and add @myEN at the end.

Alternatively, there’s a Twitter client called ‘Twipple’ that will let you do the same thing. It currently works only with iOS devices, however, a social networking app called ‘Seesmic’ will allow you to send tweets to Evernote from your

connect to a Wi-Fi network? The memory card called ‘Eye-Fi’ fits into your digital camera’s SD card slot. Your clicked pics are automatically and wirelessly uploaded to your computer, phone or tablet. Its Evernote integration enables your pics to be sent as picture notes. Say, you’re out in a forest taking pics with no internet connection of any sort. Whenever you walk into the range of a hotspot, the card will automatically send all the queued-up pictures into Evernote. What more, pics with text are recognised by the note taking app thanks to its optical character recognition (OCR) feature, increasing its efficacy. Get it here: <http://www.eyefi.com/> for approximately Rs.3710 (2 GB) and going up to Rs. 13,556 (8 GB).

Chat from Evernote

One of Evernote’s newest features is ‘Work Chat’. The in-built option enables you to

Evernote - connect to google

iPhone or Android device. TweetDeck and Twitter for Android are other services that will let you do the same via the icon.

Send pics directly to Evernote from your DSLR

Did you know that there’s an SD card which lets you con-

nect to a Wi-Fi network? The memory card called ‘Eye-Fi’ fits into your digital camera’s SD card slot. Your clicked pics are automatically and wirelessly uploaded to your computer, phone or tablet. Its Evernote integration enables your pics to be sent as picture notes. Say, you’re out in a forest taking pics with no internet connection of any sort. Whenever you walk into the range of a hotspot, the card will automatically send all the queued-up pictures into Evernote. What more, pics with text are recognised by the note taking app thanks to its optical character recognition (OCR) feature, increasing its efficacy.
