Geek life

"You got the time?" "Yeah, let me just charge my watch."

an effort to score a piece of the pie before things get too hot. And although Silicon Valley geeks are all too eager to put one on your wrist, the question that begs to be asked is: How many of us are actually interested in buying a smart watch? After all, moving beyond the snob quotient, isn't it just another gadget you need to worry about charging constantly? The screens on most of these watches are too small to read more than 2-3 lines of text. And anything that you can hope to do with a smart watch, you can do equally if not more easily do by simply pulling your phone out of your pocket. Android Wear developers even announced that your smart watch won't work unless it is connected to an Android phone or tablet. Perhaps the real problem with smart watches is that, as of now, they don't really bring anything new to the table in terms of user functionality apart from being the new gimmick that gets everybody's attention at the party. If manufacturers don't think of new innovative features for smartwatches, they won't stand the test of time.

4 Xbox One

Gamers buy gaming consoles to play games and not to watch TV; that's not too complex an idea to understand. Yet in an effort to make their product more versatile, the guys at Redmond gave Xbox One a few features that no one really asked for, making it an odd love child of a gaming console and an all-purpose entertainment system. And god help you if you didn't like the boxy Metro UI of Windows 8 because you're going to see it each time you turn on your Xbox One. Add to that the unbelievably complicated DRM restrictions and

you begin to understand why a lot of gamers are not only looking beyond the hype of Xbox One but are quite frankly hoping that this isn't the future of gaming they were promised. The cloud-oriented nature of Xbox One also means that users always need to be online in order to play most games; even

in the case of single player, offline games, users need to login at least once each day. Many have even criticized Microsoft for being anti-consumerist.

5 Google glass

Google Glass was made available to consumers in the US in May this year, and you could get your hands on one if you happened to have an uncle there. A certain website lists "a conversation starter" as one of the pros of Google Glass; well, if you need an awkward-looking gizmo wrapped around your face to start conversations — maybe you should just give up and quit trying. Jokes aside though, there just aren't a lot of real-world applications for Google Glass at the moment. You can click photographs, make a video, ask for directions, search Google, check your social media accounts, and send a message. That's about it. Plus, there are a lot of security and privacy concerns bogging it down that need to be sufficiently addressed and tackled. Not to mention it's going to be really difficult

Nice try, Microsoft.
