

Tesla and BMW unite

Tesla and BMW are in talks on a collaboration for sharing batteries and other lightweight components.

Air quality detector

A wearable device that uses optical sensors to detect pollution will build real time air quality maps. <http://dgit.in/AirQualCla>

Voyeurism made easy.

not to come across as a raving lunatic while muttering commands into it when you're walking down the street or sitting in a coffee shop. And it's expensive.

6 Ello

Ello is a social network with a mission. "You are not a product," reads its slogan, and I'm sure that it's an idea what we can all get behind. Its manifesto states that on networks such as Facebook and Twitter, "Every post you share, every friend you make, and every link you follow is tracked, recorded, and converted into data. Advertisers buy your data so they can show you more ads. You are the product that's bought and sold." This is all absolutely true. Ello pledges never to show ads or "sell you"; it received significant press coverage after launch, has over a million users and was being branded as the "Facebook Killer". It's a lofty idea, but it isn't easy

to trump a network that has 1.3 billion active monthly users. And so even though it was launched with much fanfare, Ello is finding it difficult to live up to its own hype. Firstly, being new, Ello simply isn't as refined and user-friendly as Facebook and Twitter are. Secondly, there aren't enough users on Ello for it to be interesting in a way that Facebook is, for instance. Lastly, there have been rumors that it has accepted venture capital — and since venture capitalists never give out money for nothing, it's difficult to see how Ello plans to remain the always-free-forever service that it started out to be.

7 Yo

Earlier this summer, a little app called "Yo" which was released on April Fools' day for Android and iOS almost broke the internet when news of it raising \$1.5 million started doing the rounds on various news websites. Even

the app's founder, Moshe Hogeg, admits that it's stupid app. It's the perfect example of how strange things can get blown out of proportion in Silicon Valley. Here's what the app does: It allows users to send and receive "Yo"s to people added in your app as contacts. That's it. It does nothing more. It's simplicity (if you can call it that) was the reason that got so many people from developers to investors wondering why on earth would someone invest so much money into an app which does close to nothing. But Hogeg thought they were on to something. Since its release, Yo has been downloaded 2 million times and at its peak, 4 million "Yo"s were sent in a day. But after the initial crazed died down, the app has witnessed a steady decline in user interest. The developers keep talking about the million ways in which the app can be used in the future, and it very well may be, but as of now, it's one damp squib.

8 Internet of Things

Tech companies have finally found a way to make you watch ads on your microwave while you make popcorn. Internet of Things is a natural progression of electronics wherein everyday objects such as fridge, microwave, TV, cars, dog collars, door locks, vending machines, clothes, shoes and even diapers are connected to the internet and each other. One of the most common examples given to explain the Internet of Things goes something like this: You run out of milk, your fridge automatically detects it, and orders a fresh carton for you. As geeks we don't sit around trying to analyse if this is indeed a legitimate problem that needs to be solved; it just sounds way too cool to debate that. But then again there do arise two problems that we aren't ok with: One, imagine the privacy nightmare when almost every little gadget inside your home starts keeping a log of what you do, from your food habits to how many times you visit the bathroom! And the second problem ironically is that the IOT dream is taking way too long to come to fruition, which is why it finds a place in our list of over-hyped things. Unless the Internet of Things actually promises anything remotely useful, it will remain in the over-hyped category. **[d]**

Struggling to live up to the hype.
