Samsung Galaxy S6 Edge

The bleeding Edge

To say that the Samsung Galaxy S6 Edge is a looker would be a massive understatement. There's nothing like it in the market right now. The LG G Flex 2 may be curved, but it really catches your eye from certain angles. It's not the same with the Galaxy S6 Edge. It's sure to turn some heads.

I'm not a big fan of the glass on all sides, because it means there's that much more to break. Smartphones are usually the strongest on their sides, but that part of this phone is covered by the edge display. But then again, you're going to be extra careful with a device that costs Rs. 58,900 anyway aren't you?

I won't say that this is the sturdiest device out there, but it's as premium as it gets. If Samsung's goal was to take on the premiumness of the iPhone, then the S6 Edge is the one to pit against it. Not the Galaxy S6 mind you, the S6 Edge.

Samsung makes the display feel and look so much better than anything out there. Yes, I can see Apple fans arguing about the benefits of Retina, but really, the Super AMOLED here is without a doubt the best display on a compact smartphone today.

As always, the colours are on the warmer side, but 577 ppi coupled with amazing viewing angles, thanks to the Edge, makes this the best smartphone display today.

While there are quite a few pre-installed apps on this phone, it would be wrong to categorise apps like WhatsApp and Microsoft's OneDrive etc. as bloat. Do I wish I could uninstall what I wanted? I sure do.

I don't really have a problem with Touchwiz as an UI, but a lot of the things can be seen as useless. Flipboard takes over the screen that is handled by Google Now on the stock launched, but it is nowhere as seamless. It's not stitched into the launcher, like HTC's Blinkfeed. Hence, swiping over to that screen will stop your phone for a second or two while Flipboard boots up. The Edge display on the S6 Edge though is a gimmick.

Price
₹57,399

There's no separate panel here, it's simply one panel with curved glass, which severely reduces the functionality. There's not much that you can do with the edge, except some quick calls and different colours for some preset callers. While the Edge adds a lot to the phone's looks, it doesn't bring much by way of functionality.

Its processor is right up there on performance.

The phone doesn't seem to throttle the processor very easily, even though it does heat up fast. Over extended periods of gaming, the S6 Edge doesn't seem to throttle the processor for at least the first 15 minutes. Even after that, the effects of throttling aren't as apparent as they would be on most

other smartphones. If you're a big gamer and play high-end games on your phone, you would love using this.

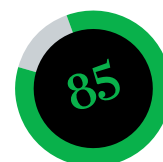

Despite the performance though, what you buy it for is the 16MP rear camera. The rear camera is the true hero of this device. It's one of the fastest cameras out there and takes brighter images than the iPhone 6, along with better details.

On a 2,600 mAh battery and a QHD display, we never expected the Galaxy S6 Edge to be a battery beast. On a normal day's usage, the S6 Edge lasted us just about the full day. With about an hour of gaming, lots of calls and texts, and boat loads of camera usage, this phone couldn't last us the entire day, but it did get us through when we curbed the gaming. Fortunately, it has the fastest of fast charging batteries.

If Samsung's goal was to take on the iPhone 6, then this is the phone to pit against it. The Galaxy S6 Edge outperforms the Apple iPhone 6 in both performance and camera departments, which is something no Android phone can boast. If you're looking for a flagship smartphone to buy, the Galaxy S6 Edge should definitely fit the bill.

What it doesn't do is offset manufacturers like Xiaomi, who will still enjoy their popularity in the budget segment.
