Lenovo ThinkPad X1 Carbon

The ultimate business laptop?

The ThinkPad X series of laptops have been known to be thin, light and rugged since their inception, and we've pretty much tested and reviewed every major X series milestone through the years. The latest ThinkPad X1 Carbon continues in that fine age old tradition, carrying the torch of fine craftsmanship into another year. Or does it?

The latest generation of Lenovo ThinkPad X1 Carbon looks strikingly similar to its predecessor launched quite a while ago. The screen lid is made of carbon fibre and glass fibre giving the machine its surprisingly low weight, despite its 14-inch form factor, and the magnesium alloy surface is also a bit sleeker to shed excess milligrams. The whole unit weighs just 1.3 kg which is absolutely fantastic to carry around. However, compared to the more wholesome ThinkPad T series machines or its competitor the Apple MacBook Air, the X1 Carbon feels a bit more fragile, especially around its screen. Having said that, the laptop's survived numerous trips inside a tightly packed Mumbai's local train compartment and passed unscathed. It may look flimsy and dull but it's built to last for sure.

The X1 Carbon's keyboard and trackpad continues to impress. We like the new scalloped or curved keys on its keyboard deck, with just the precisely right amount of dip and travel, offering one of the best typing experiences on a laptop, definitely better than the YOGA 3 Pro we reviewed last month and the Dell Latitude 7250. The trackpoint navigation is as great as ever, guaranteed to convert you from using its traditional touchpad - which is plain jane, devoid of dedicated mouse buttons. Just one disappointment on the backlit, spill resistant keyboard - Lenovo still continues to keep Function as the leftmost key on the bottom left, instead of Control, and that's just irritating to get adjusted to.

As far as its screen goes, the X1 Carbon has a 14-inch IPS display with 2560x1440 resolution and multitouch support. The screen's adequately bright at 218.1 cd/m² similar to the brightness on the HP EliteBook 1040, and more bright than the Dell Latitude 7250's screen. Having said that, its contrast ratio is disappointingly low. Under direct ambient light, the screen does reflect light and until

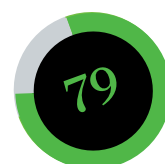

you learn to look past it it's a nuisance, but the screen's sharp and pretty good for watching movies or reading text, and its viewing angles are impressive -- so is its touchscreen experience. Onboard audio isn't great, just about okay for personal entertainment, but the 720p webcam's pretty good for video conferencing through Skype or Hangout.

As far as performance goes, with a low-voltage 5th generation Core i7, 8GB of RAM, and 256GB SSD, everything opens in a snap on the ThinkPad X1 Carbon. Routine business applications - MS Office, Video Calls, other multimedia apps - open uncompromisingly fast, and there's no room for complaint with the X1 Carbon's day-to-day performance. Where the Carbon really shines is in its battery prowess - we clocked 5 hours 9 minutes on our battery benchmark on high performance battery mode, full screen brightness - all thanks to the Intel Broadwell CPU and chipset. On a more conservative battery plan, we have no doubt this notebook can go past 7 or even 8 hours of battery life, and that's fantastic from a businessperson's perspective. At 54 degrees on full load, it's one of the coolest notebooks we've tested.

As is the case, the bundled apps and software on a ThinkPad are never really bloatware, and here too we find ThinkVantage (for maintenance) and other essential apps (for backup, recovery, etc) on the Carbon that makes it more appealing to businesses. Overall, definitely the best performing business laptop we've tested this year, and recommended to anyone who can afford it. If it was priced around 1.5 lakhs, it would've been a more appealing deal.
