Apple buys maps!

Apple Inc recently acquired a navigation company to improve mapping services. Read more: <http://dgit.in/1B6X5WI>

Yu Yuphoria

Good but not the best

The Yu Yureka is a good looking device, easily the best in the sub-7k segment right now. The addition of metal on the side can easily sway a buyer towards the Yuphoria. The rounded metal edges though add more than just looks to the device. The rounded edges fit right into your palm, making the phone feel very natural while you hold it. The looks are unique for the budget segment.

The first pitfall for the Yuphoria is in its display. There's a definite pinkish hue all over the display, which makes apps, images and videos look weird, if not bad.

On the other hand, its biggest selling point is CyanogenMod 12 and Android 5.0. This makes the phone only

Price
₹6,999

the second after the Moto E, to boast Android Lollipop out of the box in the sub-7k segment.

Benchmark lovers will have nothing to complain about here, the Yu Yuphoria performs just as good as the Lenovo A6000 Plus and Xiaomi Redmi 2. In general, you can play intensive games for about 25 minutes before the phone starts really heating up and the lags start creeping in.

The most disappointing aspect of the Yu Yuphoria was the camera. The camera overexposes images in bright sunlight and washes them out in indoor settings. It is also somewhat slow to focus, irrespective of the light conditions.

At ₹6,999 it's a very good smartphone to buy, as long as the camera isn't a priority for you. If you need a good camera, then the Xiaomi Redmi 2 is a better smartphone at the same price.

JBL Go

Ready, Set...

The JBL Go is a very portable wireless Bluetooth speaker aimed at the budget segment.

The JBL Go is a block-shaped Bluetooth speaker that resembles an oversized matchbox. It is very light at 130 grams and is small enough to fit into most handbags. I liked the way the Go looked and its design grabs attention in the best way possible.

Considering its size, I was surprised by the audio performance of the JBL Go but not to an extent where it would be able to compete against the larger, more expensive Bluetooth speakers. The JBL Go is reasonably loud and the audio output is without distortion

Price
₹1,999

till about 60-70% of the maximum volume level. Beyond that, there is audible crackling.

The Go is most comfortable with genres of music that depend on treble and highs. When it came to acoustic tracks or rock songs without too much instrumentation, the Go was very impressive. On the contrary, the Go disappoints when it comes to genres that rely on bass and quite frankly, if you've got a lot of EDM or other club music in your playlist, you won't get the best out of the Go.

The Go has very good battery life and even though the company claims that it's able to deliver about five hours of continuous playback, I was able to eke out 10 and a half hours.

The JBL Go is currently available for ₹1,999. It's a good buy if you're looking for a decent Bluetooth speaker that you can carry around anywhere without issues. However, if you want better audio quality and don't mind losing out a bit in the portability department, and also don't mind spending more, then look at the JBL Charge or the JBL Flip II.
