In this Philips TV, a row of LED lights running along the edge of its back panel, ambilight splashes colours from the screen on to the wall behind it, creating a unique spectacle while watching TV. It's a marketing gimmick that actually works quite well.

We spent a good month 'reviewing' this television, the 58-inch panel – tried it with Videocon UHD D2H, PlayStation 4, watched Blu-ray movies, high bitrate 1080p MP4 and MKV files, through a range of connected devices. The TV was up to task handling everything we threw at it, and watching movies and playing games on the set was quite an immersive experience, heightened by the whole

ambilight effect. It's 400Hz refresh rate to negate stutter actually makes moving images move faster.

The overall brightness of the TV is at 302 cd/m², is quite great, we have no issues with the TV's sharpness and colour reproduction capabilities. The TV comes with a lot of wireless screen-sharing features, including Miracast, and its on-screen menu is a bit difficult to navigate at first. We especially like the smart remote Philips bundles with this set, as it has a dedicated QWERTY keyboard on its flipside, coming in handy while typing something in the TV's browser. 3D works well, and if you can afford it, this is a fine UHD television to buy right now.

ECS LIVA X Mini-PC

Small, Cool and Economical

Take a Mini-PC and shrink it down further and you'll get a LIVA X. This isn't the first time we've got our hands on Mini-PCs with low TDP but it sure is the first to come in a size that's so small, it feels deceptive. The LIVA X has an Intel Bay Trail-M SoC which has a TDP of 4.5 W which is similar to the credit card sized computers that are all the rage these days. The device is really well built from the placement of components inside to a really massive heatsink which not only does the job of a heatsink but also adds bulk to the product enabling it to stay in one place and not tumble at the slightest tug on one of its wires. The device did not heat up to the extent that laptops do even during the peak portions of PCMark so the passive heatsink works well.

Wi-Fi and Bluetooth are powered by an Azure-wave AW-NB087H which is a 1T1R 802.11n chip. 1T1R radios are sufficient for a client if you're not going to be streaming video content above FullHD. Unlike the Mini-PCs that we generally get to see, the RAM and Storage on the LIVA X are actually BGA chips so upgrading them isn't an option though if you ever need more storage then there is an mSATA expansion slot provided. Getting to the expansion slot requires you to pull the heatsink and it does take a little effort since the thermal pads are quite sticky. It doesn't sacrifice on aesthetics and given the usage scenario, the LIVA X is more than capable of getting the job done, i.e. we mean internet surfing and working on spreadsheets.
