750, nearly double of what the Xiaomi Mi4i can offer.

Another great performer was the Yu Yuphoria, which

showed good results for its price tag. The Yuphoria clocks around 23,000 on AnTuTu, while excelling in other areas as well. The Yuphoria is followed closely by the Xiaomi Redmi 2 and Lenovo A6000 Plus. The extra 1GB RAM on the Yuphoria and Redmi 2 allow them to edge past the Redmi 2 in this test, but the Xiaomi device still proves itself to be a formidable competitor. In addition, the 4G variant of the Moto E finally comes closer to its competitors in terms of the performance. The lower resolution display on the Moto E allows it to clock higher GPU scores, while the CPU performance is pretty much the same. Of course, all this comes at a higher price tag and the camera is still very weak.

CAMERA

The competition was much closer in the camera department. In the end, it was the Xiaomi Mi4i that came out as the winner, but what we were

very impressed by was how close some of the sub-7k devices came to the winner, particularly the Xiaomi Redmi 2.

It goes to show Xiaomi's prowess in the camera department. While the Redmi 2 isn't at the same level as the Mi4i, it's still a very good camera and one that anyone buying a sub-7k smartphone would be happy with.

The Mi4i on the other hand combines accuracy and speed to come out on top of all others. The shutter response time is minimal and it produces very good images in all light conditions. It is a little weak in low light conditions, but still much better than any other smartphone in this price bracket. Moreover, the Mi4i has an amazing HDR mode, which produces bright and vibrant images, even in low light.

It is also important to note that the Asus Zenfone 2, which also has a 13MP camera like the Mi4i, doesn't hold a candle against this device. The Zenfone 2's camera is passable at best and not as great as the Mi4i.

Lenovo A6000 Plus
