

Dodge Viper ACR

It's everything, and more

Dodge has unveiled its fastest, street-legal Viper track car, the 2016 Dodge Viper ACR. The ACR is designed to exact every fraction of a second that it can. Developed with the help of the lessons learnt from the Viper GTS-R, the makers of this new beast have delved into three aspects: aerodynamics, chassis and tires, delivering enhanced grip.

Under the hood, this Sportscar is loaded with an all-aluminium 8.4-litre V-10 OHV (Overhead-Valve engine,) rated at 645hp and 600 lb.-ft. of torque – the most torque of any naturally aspirated sports-car engine in the world. The designers at Dodge have also enriched this piece with Brembo Carbon Ceramic Matrix brakes that are exceptionally resistant to fading and provide excellent stopping power.

Another amazing feature of the ACR has to be the Extreme Aero Package. The model produces a maximum aerodynamic downforce of nearly a ton at a top speed of 285km/h, thanks to this package. It comprises of an adjustable dual-element rear wing, a rear carbon fibre diffuser, a unique SRT hood with removable louvers, a detachable extension for the front splitter and four dive planes.

Razer Sharp

16.8 Million Shades of awesome!

It seems that the designers at Razer have finally tapped into a gamer's true desire. What is this desire? An ambilight mouse pad! And yes, we're being sarcastic. That said, the mouse pad is exceedingly cool and while it's not actually an ambilight device, its got embedded LEDs that can display upto 16.8 million colours. This rounds up

Razer's Chroma collection and is sure to be an imperative part of gamers' desks the world over.

The mouse is for sale only on Razer's store, but as expected, it's priced at an exorbitant ₹3,800.

Google + Skrillex = Edition

Google recently introduced an interesting accessory for Android devices called Edition cases. These cases, which comes in sizes compatible with that of the Nexus 5, Nexus 6, Samsung

Galaxy S5, S6 and Note 4, are complemented with a live wallpaper that displays satellite-captured images of Earth and a customisable button. All this plus a tie-up with Skrillex. An attractive proposition?

SECURITY WATCH

Hangouts conversations can be wiretapped

Google has admitted that Hangouts conversations do not have end-to-end encryption, meaning that the company can tap into those sessions when

it receives a government court order requiring it to do so. "Hangouts doesn't use end-to-end encryption. This makes it technically possible for Google to wiretap conversations at the request of law enforcement agents, even when you turn on the "off the record" feature, which actually only prevents the chat conversations from appearing in your history—it doesn't provide extra encryption or security," explained a Google spokesperson.

VENOM exposes virtual machines on unpatched host systems

A new vulnerability known as VENOM has been discovered and it could allow an attacker to escape a guest virtual machine (VM) and access the host system along with other

VMs running on this system. The VENOM bug could potentially allow an attacker to steal sensitive data on any of the virtual machines on this system and gain elevated access to the host's local network and its systems. The VENOM bug (CVE-2015-3456) exists in the virtual Floppy Disk Controller for the open-source hypervisor QEMU, which is installed by default in a number of virtualization infrastructures such as Xen hypervisors, the QEMU client, and Kernel-based Virtual Machine (KVM). VENOM does not affect VMware, Microsoft Hyper-V, and Bochs hypervisors.

ISPs asked to block websites of Uber, Ola and TaxiForSure

The Department of Telecom (DoT) has reportedly asked the Internet Service Providers to block websites of Uber, Ola and TaxiForSure in Delhi. The DoT letter, which was

issued to ISPs, invokes Section 69A of the IT Act to block access to the websites of these taxi aggregators. ISPs, however, may write to the telecom department to express their inability to block these websites. The Ministry of Road Transport & Highways (MoRTH) later made provisions in the Motor Vehicles Act to register and operate app-based taxi services within the jurisdiction of states so that competition is allowed to grow. "We do not want to throttle competition. But these services have to operate legally and in accordance with some provisions. In the event of a complete ban, it is the consumer who will suffer," says a government official.
