

CHALLENGING THE CHALLENGE

One of the biggest challenges in India is the lack of pervasiveness of knowledge and technology across the vast expanse of this country. Ensuring a well-connected India with access to broadband in the farthest corner; digital literacy; and availability of solutions that enhances every citizen's livelihood are the primary measures to be taken for Digital India.

Bringing about a revolution in Digital literacy is one of the three vision areas as part of the Digital India plan. The only way to tackle this problem is to provide universally available digital solutions that can be easily accessible in Indian languages and can be used from any remote corner of the country. The focus obviously needs to be on providing portability through the cloud and fostering collaborative platforms to enable participative governance and growth.

Intel has been working with the Government and eco-system to scale digital literacy throughout the nation under Intel's Digital Skills for India initiative, through which Intel is committed to train 5Mn people with digital literacy skills by the end of 2015. From secured and managed digital infrastructure in Data Centers for storage, connectivity, data transfer, and analytics; Accessible, Affordable Computing Devices & Solutions with High

Performance Computing devices; to Skill Development & Capacity Building through the various initiatives and programs, Intel is accelerating Indians with its innovations and making India digital.

INTEL'S COMMITMENT TO IMPROVE DIGITAL LITERACY VIA DIFFERENT INITIATIVES

Intel is enabling citizens of India to be digitally literate. The programs designed to equip them

with digital skills include Intel® Teach Program that has trained over 18 lakh teachers in India to use technology for the past twenty years; Intel® Learn Easy Steps that helped in spreading digital literacy to 38 lakh people under National Digital Literacy Mission, which is co-founded by Intel; and Intel® Digital Skills Training Application, which is comprised of Digital Literacy, Financial Inclusion, Healthcare and Cleanliness in 5 Indian languages. Intel has also launched an initiative, in association with Bharat Broadband Network Limited, that aims at imparting digital literacy to key resource persons in the first 1000 Panchayats under the National Optic Fibre Network roll-out in India.

Intel has been fostering innovation since its inception. Driven by Moore's Law, it has been initiating various programs that create huge economic value and drive social advancement for over two decades in India. The milestones achieved are reflected in the success of Intel® International Science and Engineering Fair that has had over 180 winners, with 18 of them receiving the honour of having minor planets named after them; Intel® Higher Education Program, which promotes innovation and entrepreneurship, and has reached 235,000 students and 4,500 faculties across 550 institutions so far; and Intel® PhD Sponsorship program that looks forward to enhance the quality of research in the nation.

The Intel® International Science and Education Fair for 2015 was completed on 15th May with awards being given out to 9 Indian Students across various categories. A total of 17 students from India were selected for the Intel® ISEF from the National Science Fair held by Initiative for Research and Innovation in Science. The top prize for \$75,000 i.e. the Gordon E. Moore Award, went to Raymond Wang, 17, of Canada. Onkar Singh Gujral, 18, of La

Martiniere for Boys in Kolkata, won the Association of Computing Machinery first award and the second award in the System software category for his entry on image processing algorithms for detecting nanomaterials.

These are some of the other winners from schools in India:

1. Mansi Aggarwal, 17, and Harshit Jindal, 14, of Maharaja Agarsain Public School, Delhi: Fourth Award in Plant Sciences category for research on "An Effective Herbal Ointment against Enterobiasis"
2. Ravi Pradip, 17, of Dayapuram Residential School, Kozhikode, Kerala: Third Place in Material Sciences for work on "Plumeria Blooms for Organic Electronics"
3. Arsh Shah Dilbagi, 17, of DAV Public School, Panipat, Haryana, Third Award in Embedded Systems category for developing "TALK-An AAC Device: Converting Breath into Speech for the Disabled"
4. Aditya Bhargava, 16, and Komal S, 16, of Sharada Vidyanikethana Public School, Mangalore, Karnataka: Fourth Award in Material Sciences for work on "Highly Sensitive Nano-Ferrite for Detection of Carbon Monoxide in Air"

Not only in India, but internationally, Intel has been conducting the Intel® International Science and Engineering Fair (Intel ISEF), a program of Society for Science & the Public (SSP). This has come out to be the world's largest international pre-college science competition. Approximately 1,700 high school students from over 75 countries, regions, and territories are awarded the opportunity to showcase their independent research and compete for approximately \$4 million in prizes.

Intel® ISEF unites these top young scientific minds, showcasing their talents on an international stage, where doctoral level scientists review and judge their work. SSP partners with Intel – along with dozens of other corporate, academic, Government and science-focused sponsors – who provide the support and awards for Intel ISEF.

INTEL® INDIA EMBEDDED CHALLENGE

The focus of Intel® India Embedded Challenge is on designing embedded solutions around a wide range of application areas. As a part of the Intel® Higher Education Program, this competition enables and mentors young innovations to scale up their level of thinking and creativity. Moreover, Intel® IEC offers a strong mentorship platform where Intel technologists volunteer their time

Former President of India Dr A P J Abdul Kalam with Team India prior to their departure for Intel ISEF 2014
