

differentiation. The information that most people would and should seek is about bloatware, because pre-loaded and useless apps will reduce your phone's overall performance because bloatware run in the background and consume precious resources. Bloatware is a nuisance and some manufacturers plague their phones with them. Which is why many people either root their device or select something that offers a pure vanilla UI experience like Google's Nexus range.

Storage

Despite all of the above, your phone can never really be future proof unless you have storage options. While 16GB with SD card is considered to be the minimum, in reality, you should be looking at 32GB with or without the added SD card support. If you do not have any music or videos on your phone, 16GB with SD card may still be enough for you, but why take the risk right?

Over time, your smartphone will have a lot of data saved from different apps, which means storage is an important aspect of future proofing your device.

Battery

As you may already know that the bigger the battery, the better it is for you. Although a bigger battery doesn't automatically mean better battery life, it is still a good thing to have. Reviews are the only

way to find out about this before buying a phone. Since you can know whether that big battery in your device of choice actually translates to an improvement in real-time battery life of that particular device.

Camera

This is another area where reviews are the most helpful. Camera quality isn't determined by the megapixel count and so, you shouldn't fall prey to the entire myth about more the megapixels, the better the camera. What you could find out though is what kind of sensor your phone of choice is using. Sony and Samsung sensors are prevalent, but Sony's EXMOR RS sensors are arguably considered the best and you'll find them in most flagship devices available nowadays. Smartphone cameras these days also come with 4K recording capability and so, you can buy the ones that offer 4K recording if you so desire. If most of your camera usage will be to snap selfies, make sure that the phone you're going for has a good front facing camera with a decent sensor.
