

Wait, what?

Collectively speaking, humans have spent a little more than 6 million years playing World of Warcraft. <http://dgit.in/1IGIpVX>

Safety First

Artefact has designed a backpack for cyclists that glows the moment the cyclist turns. <http://dgit.in/1KhLQmF>

DO

went on to become 'Watch Later', which is essentially a playlist of saved videos.

'InstantQueue for YouTube' is a Chrome extension that brings back the queueing feature to your interface, letting you add videos by simply dragging and dropping them over the queue window. Another advantage of this extension is that it lets you export or save these temporary queues as playlists to your YouTube account. You can reorder the videos in the queue as per your preference. One thing to note is that the queue will run only under a single YouTube tab, opening another tab with YouTube won't pull the videos from the other queue. Also, if you play or refresh the page, it will break the queue and you'll have to click the video from the queue again to continue with the remaining videos.

3 Play YouTube videos in the background

There may have been times when you wanted to play YouTube videos while using another app on your smartphone. By default, the official YouTube app on most platforms doesn't support background playback, but there's a walk-around to this. On the BlackBerry OS, the YouTube app runs seamlessly even after you've minimised it. It continues playing even after you've locked your phone.

To play YouTube videos in the background on iOS devices, start playing the desired video on the Safari browser app and minimise it. Then, swipe up to navigate to 'Control Center' where you can resume the video by tapping the Play button. This trick works on all video streaming websites opened through Safari, and works on iOS 7 and iOS 8.

On Android, it's a considerably longer

process if you want to play YouTube videos in the background. You'll need a rooted phone, since you have to install the Xposed framework module. Xposed gives you hundreds of modules that enhance and bring in more functionality to certain apps. You can download the .apk file of the Xposed framework at <http://dgit.in/XposedFr>. After installing the apk, search for the YouTube Background Playback module and install it. Reboot your phone and enjoy this new feature that works with the official app. If you're paranoid about bricking your phone, then you're better off using an app – such as Wiper Messenger – that plays YouTube videos in the background.

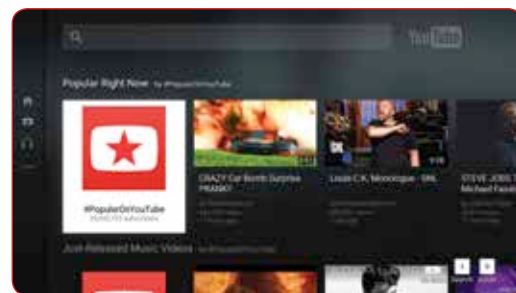

4 Remotely control YouTube from your smartphone

Having a big screen has its own perks, some of which includes endlessly watching videos on YouTube. Wouldn't it be great if you could remotely control your PC/laptop/smart TV from your smartphone? 'YouTube Leanback' lets you control YouTube on either your PC, laptop or smart TV. Head over to <http://youtube.com/leanback> on your browser. Scroll down to Settings > Go to 'Pair Device' and you'll be given a pair code. If you have the YouTube app installed on your smartphone, go to Settings > Connected TVs > Add a TV and enter the code. Now, you can control the videos on YouTube using your smartphone. If you don't have the

YouTube app installed, you can visit <http://youtube.com/pair>, enter the code and start streaming videos through the browser.

5 Quick actions

'MagicActions' is an extension available for Chrome, Firefox and Opera that gives you many useful and interesting features, including dynamic background lighting. You can download

With YouTube Leanback you can use your smartphone as a remote

the extension to your respective browser at <http://www.chromeactions.com/>. Controlling the volume with your scroll wheel proves to be the most useful feature in this extension. Once installed, you'll find a few buttons below the YouTube player that gives you some of the

options from the extension.

Talking about interesting features, the 'Cinema' mode exploits the screen's real estate very well. The Cinema mode brings up a good looking backlight at the border of the video. The dynamic backlight feature changes the backlight in sync with

The Cinema Mode in MagicActions gives you the option to enable dynamic lighting

the video playing, giving you an ambient experience of watching videos. You can take a screenshot of the video playing by clicking on the Screenshot button below the player. Doing this opens up another tab where you can further edit your screenshot and save it according to your preferences. The MagicActions extension also brings up a button on the top-left corner of the YouTube webpage, which changes the theme of the page to dark. 

InstantQueue will let you queue videos on the go while browsing through YouTube
