

LOL Mania

Two atoms were walking along the road when one of them said, "I think I lost an electron." "Really," the other replied. "Yep, I'm absolutely positive."

Orderly chaos?

Tom Cruise once complained to NASA that its website was too disorganized and even helped in redesigning it. <http://dgit.in/1KfDxaX>

Get addicted!

We already showed you how to not be a pirate and go legit, here we'll show you how to get hooked.

By Elroy Desmond
readersletters@digit.in

Do you have access to high-speed broadband internet? Are you a massive aficionado of Movies, TV shows, and video games? Do you find yourself always on the hunt for quality content that you can consume in a jiffy? If you've answered yes to all the above questions, then congratulations, you are hooked to a drug so potent, coke dealers are shaking their heads in concern.

Digital games and media have such a massive consumer base that the volume of sources through which "addicts" can gather and consume such content are limitless. While Google is always your friend for this, we've gathered some sources to placate your addiction without the hassle of having to sift through the mire of substandard content. After all, we prefer to get our hands on only the best stash.

Movie and TV content

How to get hooked

Jinni

Jinni is a TV and Movie recommendation service that fashions itself in the ilk of Pandora (a popular music recommendation service) for Movies and TV shows. Its recommendation algorithm is based on

the Movie Genome Project (just as Pandora's is based on the Music Genome Project), which takes into account over 2,000 "genes" such as plot, genre, mood and setting. Jinni does not, however, rely 100 per cent on a computer-based system. It also attempts to incorporate a social element by letting you view your Facebook friends' watch lists for a more personalised experience.

Jinni's main selling point is its incredibly detailed search tool. Hunt for new titles by supplying the tool with a mix of parameters including mood, plot, genre, time/period, place/setting, and attitude. The quality and quantity of content on display is quite impressive. Quick fact I learnt using this tool: there are ZERO movies with both tags "Zombie" and "Thought-provoking." Who would have thought?

How to stay hooked

Trakt.tv

While services like Jinni focus on helping you find the right content, Trakt.tv offers users with an excellent watch-list tracking and TV schedule organizing tool. Sporting an intuitive and easy-to-use interface, the service endeavours to help TV binge watchers keep a keen eye on their consumption habits. Trakt also supports integration with your PC/media centre (e.g., XBMC or Plex) or Smartphone via apps like TeeVee (iOS) and SeriesGuide (Android). This saves you from the hassle of having to manually update your "watched" list. Add this to its intelligent recommendation system, and you can experience watching TV old-school style with schedules and guides, instead of going on a ridiculous binge.

Although Trakt.tv is a free service, it does offer a premium

Just one more episode, man! You know you want to!

account that adds a bevy of useful features. Highlights include zero adverts, integration with third-party productivity apps such as iCal (for iOS users) and IFTTT (for iOS and Android), and early access to new features—or as some would call it, paying to beta test new features. (-_-)

Twee

Sometimes, all you need is a simple app to help you track the progress of your favourite TV shows. Twee is an easy-to-use app that packs in a load of features with an interface that is, at best, not overly daunting to use. Its core functionality is centred on users making a list of TV shows and keeping a track of watched episodes by manually marking them as "watched". It makes use of the tvdb.com database, which provides concise episode summaries for all popular TV shows.

Some of Twee's other features include multiple profile management (ideal for shared smart devices such as tablets or SmartTV sticks), trending lists, and widget support. The app also allows you to backup data, letting you share tracking lists between other devices. Twee is currently only available for Android.

iShows

Like most popular paid apps, iShows showcases excellent design, in terms of

"Are you kidding me? I paid for 1080p content so I wouldn't have to see pixels!"
