10 things to DO with Windows 10

Summer 2015 (whatever that is) is just around the corner – that's when you can get your hands on the official release of Windows 10. Can't wait that long? Download the latest 10074 Build because here are 10 cool things you can do with it right away!

Upgrade for free

One of the first things you can do with Windows 10 is to get it for free. Microsoft seems to be intent on getting as many people as possible running Windows 10 as soon as possible. To enable this they are offering — for the first time ever — the new version of Windows as a free upgrade to anyone running not only Windows 8 / 8.1 but also users of Windows 7.

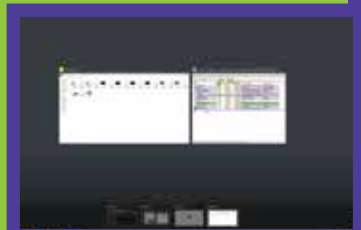

Microsoft is also coming up with "attractive" upgrade offers for those running illicit / non-genuine / pirated versions of Windows.

1

Organise yourself with virtual workspaces

Linux and OS X users will be well versed with the concept of virtual desktops / workspaces. This feature allows users to group related windows together and then switch between these groups of windows just as you can alt-tab between individual windows right now.

Each group gets its own virtual screen area allowing you to have different sessions active at a time while focusing on only one. If you are doing a couple of things at once, you can segregate the windows at a time. For instance, one virtual workspace could have your photo collection and a photo editor open, while another is running your work email and a word document, and yet another could have your music player running.

The implementation of virtual desktops in Windows 10 allows users to create new desktops.

3

Keep updating for free

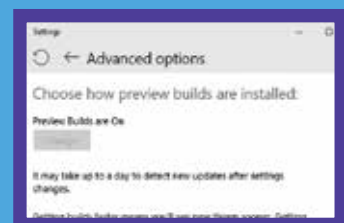

With the notable exceptions of Windows XP SP2, and Windows 8.1, Windows updates have usually just been about bug fixes and security patches. With Windows 10, that is about to change forever.

Microsoft will continually release not only bug fixes to Windows, but also new features through Windows Update. Users who would prefer to run a stable version of Windows with just bug and security fixes can opt for a slower update track, while those willing to experiment more can opt for a faster or even a beta release track that can give them features that are still under development.

The aim here is that once you purchase a device run-

ning Windows 10, you never need to purchase a Windows upgrade for that device. The current Windows 10 preview build occasionally releases entirely new builds of Windows with major changes through Windows Update.

Microsoft developer evangelist referred to Windows 10 as the 'last version of Windows'. Windows 10 could be around for a very long time, looking and working quite differently in a few years, bringing in new features. All you need to do to upgrade your OS to the latest release of the installed Windows 10 and run regular Windows Updates.

Windows 10 will give users a choice to be more conservative with updates.
