DO

Buy good-old Windows Apps from the Store

The Windows 10 store will allow users to install more traditional desktop apps.

You'll still be able to install and run traditional applications as always, a feature which is absolutely essential. What Microsoft needs to do though, is a better job of managing the store than they have done so far. The Windows store is rife with fraudulent and fake products that often remain available for far too long.

4

Windows 8 introduced a new store, but the store was overly restrictive. It would only offer the new ModernUI applications in the store that were introduced for the first time with Windows 8 and these applications would only be available from the Windows Store.

For Windows 10, Microsoft has already released developer tools that allow for the creation of 'traditional' Win32 apps — the kind that ran on Windows 7 and below, not the new Modern / Metro apps — that can be sold on the Windows store.

The new Xbox app for Windows 10 allows gamers to message friends, track gameplay and achievements and more.

Get back into PC gaming

With the Xbox console making money for Microsoft not only from the sale of the console and its accessories, but also from each game, it's easy to see why they abandoned the PC as a gaming platform. Halo 3 wasn't released on Windows, and it's not controversial to say that Games for Windows Live never got accepted by gamers.

Microsoft seems to have had a change of heart, and are trying to win back PC gamers, perhaps as a pre-emptive strike against SteamOS. With Windows 10, Microsoft will include a host of gaming features such as the ability to stream Xbox One games to Windows (hopefully the other way around as well), and to record and share in-game videos.

7

Keep your system clean with virtualised application installs

With new apps available on the Windows store, there is always the worry that poorly coded apps, or malware will damage the user's computer. Also, installing and uninstalling applications leave a thick layer of digital garbage all over your system.

The good news here is that apps installed from the Windows store, even the traditional Win32 apps, will all be installed and run in isolation. Windows will manage how and where they write their data to the registry and file system, giving each app a virtualised view of these resources. When you uninstall an application installed using the Windows store, it will leave no trace behind. So go ahead, install from the Windows Store and be sure the app will be gone just as easily as it was installed.

5

Run 'Modern' apps in a window

Microsoft tried its best to counter some of the worst limitations of the Windows Modern apps by releasing their Windows 8.1 update, however, they are still far from coming up with a comfortable experience on desktops and laptops.

As expected, Microsoft has gone for more of a middle road in Windows 10, with the ability to run Modern apps in resizable windows. They are also making these apps, for all intents and purposes indistinguishable from traditional Windows Win32 apps. (Other than the fact that such apps still can't be sold or distributed outside the Windows store.)
