

A Beginner's Guide to Coding Projects

>>There are a lot of things you can learn and practice in the world of programming, so where do you get started?>

by Rajat Motwani

When the entire world is moving towards Information Technology, why shouldn't you? Wouldn't it be great if you could be a part of this revolution by making utility applications and projects, or otherwise doing your part to improve the digital landscape?

Taking up a project involving an unexplored or relatively new technology poses a great challenge for programmers, but the key to success comes through ambition tempered by pragmatism. Taking up challenges and aiming higher are good virtues, but at the same time it's essential to know your potential and limitations. It's easy to get stuck in a rut with no means of getting out otherwise. If you have just entered the world of programming with little to no knowledge of coding and its applications, you can start off by referring to the "Learn to code" section of this edition's

FastTrack. Even if you are a newbie, learning via projects is a fast and practical approach to programming.

Building good projects doesn't necessarily call for mastering every minor programming. What matters the most is effective practical implementation of technologies involved in software development. A good project is not only characterised by its complexity and efficiency, but by the ease and amount of functionality provided to the end user.

How to start a project?

Every programming project essentially needs two things: an idea that can be built into something innovative as well as functional and technologies that facilitate successful implementation of this idea. It is really important that you take up technologies

*coding matters

*There's a Python in your browser

>>If you want to run and execute Python scripts from a web browser, which can also run on mobile browsers, **trinket.io** is an extension that lets you do the same.

*CSS turns 20 years old

>>It has been twenty years since the first idea of CSS was proposed. This has afforded web designing a degree of sophistication that wasn't available before.
