

Grand Anti-Theft Auto

Africans can legally attach flamethrowers to cars to repel car hijackers. <http://dgit.in/1Khj0t>

Just a gesture

Aria's announced an band for Android wear that lets you control your smartwatch with gestures. <http://dgit.in/1FFvbX6>

DO

We've DOne the craziest things

Even though this issue is all about DOne things, it's nice to remember that nobody's perfect. We've DOne things in the past that make absolutely no sense today, but probably seemed like the best way to get things DOne at that time. Well, at least they tried. Here's to the DO-ers!

The Cyclomer

If you ever wanted something that was both cheap and could be used to make you feel like Jesus, this ambitious invention, called the Cyclomer, might help you achieve just that. The bike was designed to be used with tyres on land and and the giant spheres that look like wheels provide the buoyancy that's needed to keep the bike afloat.

The Manual Dredger

Dredging is an arduous, considering the amount of area to be covered and the sheer labour involved but it's essential to a functional port and as expensive as it is today, it was worse then. Regardless, someone tried to come up with a more efficient solution and the result was the manual dredger!

The Scroll-along GPS

Back in 1926, people needed a way to navigate the city without having to hold a map in their hands all the time. The TomTom Scroll-Map, a product designed by YesterYear, sought to solve that issue. It was a paper map rolled up into a box which was wired to a car. It scrolled through a roller that moved according to the speed of the car. Effective? No.

The pedestrian shovel

This invention shows that car accidents were not as rare back then as we thought. The main intention of the shovel was to roll the person away from the wheels of the vehicle, out of harms way. Why can't we have this today, especially on the front of busses? It can't be all that hard if it worked well even at the turn of the century.

The Hamblin Reading Glasses

You must really be a bookworm if you're going to buy one of these. They may not have form but they're certainly for serious readers. The glasses are actually a pair of mirrors that the reader wears so that they can read lying down completely and not strain their neck. If they had thrown in a lamp as well, the PaperWhite wouldn't have seemed so revelatory.

The Radio Hat

Humans have always had a thing for portable items. Why else would we make a hat that had a radio? The Radio Hat was manufactured by an American company and could tune into stations within a 32km radius. Certainly the design of the hat meant that it was trying to be as classy as possible, and we suppose that it represented the height of fashion.
