

iPod Touch

An iPhone that only plays music

After almost three years since its previous version was launched, Apple has upgraded the iPod Touch. Now the new iPod Touch has a faster processor, better camera and is available in six colour variants – gold, silver, space grey, blue, pink and red. The iPod Touch took a huge leap with its processor, jumping from an A5 chip to an A8 processor – the same chip running the iPhone 6 and iPhone 6 Plus. Being an Apple product, you would have expected the device to have a Touch ID but Apple decided to not add one (they'll probably add it later and double the price). The camera has really improved along with Bluetooth and WiFi upgrades. The iPod Touch will come in a 128 GB variant available as well that sells for \$399 while the 16 GB, 32 GB and 64 GB versions are priced at \$199, \$249 and \$ 299 respectively.

SPECIFICATIONS

Display Size: 4-inch (1136x640) | **CPU:** Apple A8 (1.1 GHz) | **OS:** iOS 8.4 | **RAM:** 1 GB | **Camera:** 8MP rear camera, 1.2MP front camera | **Battery:** 1043 mAh

Moov Now

New wearable in town

In a market flooded with wearables it might not be a good business decision to launch your own wearable device. Moov Now, however seems to think it has something new. This wearable pairs with an app and trains users in running, cycling, swimming, cardio boxing, and bodyweight workout. A voice instructs you throughout, giving suggestions for better results. It also tracks sleep cycle and steps using its accelerometer, gyroscope and magnetometer.

Axon Mini

Before Apple could bank on the force touch after launching it on their new Macbook, ZTE has already incorporated a force touch display on their latest smartphone – the ZTE Axon Mini.

A force touch display not only senses your touch but also senses the pressure that you apply on the screen. The phone will have a 5.2-inch Super AMOLED display. Nothing else is known, for now.

SECURITY WATCH

Hacking Team gets breached

Well known providers of spyware and malware to governments across the world, Hacking

Team has been apparently hacked. Yes, the irony is obvious. Hacking Team is an Italian company that provides surveillance software to governments and law enforcement agencies. The hack involved the leak of 500 GB of data that include client files, contracts, financial documents and more, all of them being dumped all over the Internet. The company's Twitter account was also hacked and a tweet was posted that gave the link to the 500 GB of data, revealing client names including several countries like Australia, Iraq, Mexico, Russia, South Korea and USA.

Almost 1 Million Android Users' Facebook credentials compromised

Recently, two games on the Android Play Store have been spotted trying to collect users' Facebook credentials by using

a fake login page within the apps. Cowboy Adventure and Jump Chess were responsible for taking the login credentials from the users and sending them to the attacker's server. Google has taken down both the apps and is working on improving their security to avoid such malicious attacks in the future. Before downloading new apps from the store, make sure you read the reviews and if you want to go the extra mile, you can install malware scanning tools on your phone.

Google Photos starts misbehaving

If you're an Android user, you might have downloaded and installed the new Google Photos app when it launched. Giving you unlimited storage, it automatically

ly syncs all the photos on your phone to the Google servers. The unusual behaviour of the application is that even after you uninstall the app, it continues to back up your images to your Google account. There is nothing to worry about, though. This debacle is caused due to Google Photos' settings being interconnected to the phone's Google Play Services. If you want to prevent this from happening, simply disable the sync option in the Google Settings app after uninstalling Google Photos.
