

Mi TV 2S

Xiaomi's latest TV is only 9.9 mm thick

When smartphones are allowed to slim down, why should televisions - the original commercial screens - stay lagging behind? Televisions have been thinning out over the past decade and a half, ever since the Cathode Ray became a thing of the past. But who would have thought that Xiaomi would be a company to break the visual record? The next Mi TV (to be launched globally) would just be a mere 9.9 mm thick. Said to be the company's thinnest TV ever built, the Mi TV 2S is a 48-inch TV that supports 4K playback. The thickness or the thinness of the TV is so much that it is as slim as their Mi Pad and Mi 4i device.

The Mi TV 2S runs on the latest version of MIUI (Android 5.0) running on 2 GB of DDR3 RAM with a storage of 8 GB. The TV has WiFi and Bluetooth connectivity. The screen has a Bluetooth LE remote instead of the old infrared version, and if you decide to lose it, you can even tap the bottom of the TV to make the remote beep. Alternatively, you can also install the remote app on your phone and use gestures and voice to control the TV, as well as read up on IMDB-fed info about the show you're watching. With respect to the way it looks, the newest MiTV has an all-metal body and is available in five colour variants that differ in the aluminium frames. Available in gold, silver,

pink, blue and green, the TV is set to be priced at around Rs. 30,000 for the standard edition. The other theatre edition costs at around Rs. 42,000 which will include an independent sound system equipped with Dolby sound technology.

SPECIFICATIONS

Display Size: 48-inch | **Display Resolution:** 4K | **OS:** MIUI (Android 5.0) | **CPU:** MStar 6A928
