A COLLECTION OF PRO TIPS FOR EVERYTHING. Without being limited to a particular topic, these tips are from popular software, to coding, to browsers, search, storage rules, password rules, mobile device hacks, bios cracking, tweaks explained and everything tech under the sun.

Switching to an iPhone

Solutions to all the problems you might face when migrating to an iPhone

Team Digit |

SIMILARITIES BETWEEN ANDROID PHONES AND IPHONES HAVE INCREASED WITH EVERY UPDATE, but transitioning from one to another isn't very smooth. If you are an avid Android user planning

to buy your first iPhone, then there are several problems or hiccups that you might encounter. These aren't particularly due to shortcomings of iOS, but just because of things it does differently.

Our jobs require us to be familiar with both operating systems, and the writer

recently switched back to an iPhone running iOS 16. If you have been a long-time Android user, you will obviously expect inconveniences like depending on a proprietary charging cable, transferring your data, or reworking your smart home setup. However, there are many other simple and unexpected problems that users are likely to experience. Here we have curated some of the issues that you should keep in mind before you take the plunge.

1) TRUECALLER AND WHATSAPP WEB DON'T WORK AS FLAWLESSLY

One of the major gripes is that many apps that Android users are quite habituated to don't work as seamlessly on the iPhone. Two major ones for me that I depend on for professional reasons are WhatsApp Web and Truecaller. The web interface of WhatsApp doesn't sync as flawlessly with the iPhone. Often messages that you have already viewed on the phone are marked unread on the web and at times random messages disappear on the web interface or new messages don't show up. Truecaller, on the other hand, can reliably flag Spam calls but doesn't notify of calls from unknown phone numbers.

2) APP LINKS ARE NOT AS SEAMLESS

Remember those prompts you get in the browser to check out the content in the app? Well, those work better in Android. On Android phones, these app deep links seamlessly open the content you are viewing in the app without breaking continuity.

On iOS, these app deep links may randomly divert to the App store (you'd occasionally need to update the app first), from where you need to open the app and then start afresh and search for whatever it is that you were watching or viewing in the browser.
