

9) CUSTOMIZATION OPTIONS ARE VERY LIMITED

Android users who are used to customising all aspects of their phone are likely

to a long-term Android user, but it is also incredibly reliable and consistent. Both software ecosystems have their advantages and disadvantages, and it's only

to feel crippled at first. Basics like changing default apps (except for mail and browser) or rearranging home screen icons either don't work or need special hacks. Even something as simple as using third-party tunes as ringtones is not supported by default. Thankfully, the option to view battery percentage in the status bar arrived with a recent update.

natural that consumers shifting from one to another will take time to get used to its idiosyncrasies.

WHAT IS THE SOLUTION?

As we mentioned earlier in the article, there are a host of issues that can emerge when you are moving from an Android device to an iPhone. The difference in the integration of the phones into the ecosystem hasn't

been matched yet. However, being in the ecosystem restricts interoperability of the iPhones with other devices like Windows PCs. And, there are certain apps that also act up on Android devices. To sort all those concerns, here are some of the things you can try if you are one of those facing these problems.

TRUECALLER NOT WORKING ON YOUR IPHONE?

Truecaller is like god's gift for those who receive a lot of calls through the day. While Truecaller works flawlessly on Android, the same experience is not felt by iOS users because the caller ID can only be accessed by the stock phone app unlike Android.

But where there's a problem, there is a solution. What you need to do is, on your iPhone, go to your Settings>Phone>Call blocking and identification. Under this switch 'on' all options for truecaller and the app will then work as seamlessly as an Android on your iOS too. Problem solved! First win for us.

IPHONE AND WINDOWS LAPTOP SYNC

Just because you bought a new phone does not mean you want to buy a new computer/laptop right? You still might want to connect your iPhone to your Windows laptop or computer. And, if you have tried already then you'll know how painful it can be sometimes.

Considering this is a problem faced by almost every new iPhone user the solution is given on the Apple website itself.

Firstly, connect the phone and the PC with the regular lightning cable that is supplied with your device. Then the most important part is to select 'Trust' the system you are connecting to on your iPhone when you are prompted to do so. After that you can, without an issue, do all activities on your laptop or any other Windows device as well. For some things, you will need the iTunes app as well. That you can get from Microsoft's own app store, or Apple's webpage. It is an easy to install and use app, with some basic functions baked in.

10) PAYMENTS ARE TWISTED

Subscription services and in-app purchases are generally more expensive on iOS as compared to Android. Moreover, Apple has stopped accepting credit and debit cards in India, so you will have to preload an amount between 100 and 15000 in Apple Pay to make a purchase. So, if you are buying a ringtone for Rs 18, you will still need to add at least Rs 100 to make the purchase. With these quibbles, we surely don't mean to decry the iOS experience. iOS may feel limiting
