

HOW TO RECORD CALLS ON IPHONE

Apple is one of the companies that claims to take customer privacy very seriously and reportedly goes the extra mile to ensure that their consumer's data is safe. As a part of those privacy measures, iPhone does not come with a simple 'record button' that you just click on and Voila! all your calls are recorded. You either need to use an external device or there are several third party apps that one can put to use. Google Voice is one such application where you can record calls for free. To enable it firstly download the app on your device. Then you will need to go to Settings>Calls>Incoming Calls and enable the call recording function there. To record you need to press the '4' button on the keypad and the same to stop recording.

FACETIME NOT ONLY FOR APPLE USERS NOW

Seeing how some apple users consistently faced a

problem with not being able to place a 'Facetime' call to their acquaintances who still use Android, Apple has come up with an update. The people using Windows or Android devices can still join Facetime calls provided they have a link. The key over here, though, is that the link cannot be initiated by anyone but an Apple user. After the call has been initiated, all the Apple device user needs to

does not ring when a call comes? The process is simple in Android given the comprehensive volume controls, but not so easy in iPhones. But there is a difficult way does not mean there is no way at all! All you have to do is go to the 'Sound and Haptics' under 'Settings'. Switch off 'Change with Buttons' that falls under 'Ringers and Alerts' and there. You will now be able to change the volume of your media

viewed in the 'Downloads' section and does not directly appear in the gallery. Seasoned iOS users do not have a problem with this but when switching from an Android to an iOS device, you might feel a little lost in the initial days and this is one of the problems you come across.

A user by the name of Rohit-India in 'Discussions' forum in Apple had posted a solution that worked for

do is copy the link by clicking the prompt on the call screen and copy the link to the call, which can be used on Android or Windows devices.

without hampering the ringer or notification volume.

DOWNLOADED VIDEOS DO NOT AUTOMATICALLY TRANSFER TO GALLERY

This is a problem reported by a lot of new iPhone users wherein the downloaded video or photo needs to be

them. As per the user, you need to select all the videos and click on 'share'. A popup will appear where you get an option to 'Save the Video'. Now the photos/videos shall appear in the 'Photos App' too. And there you have it! If you have any other problems, write to Agent 001, and hell' get them sorted!
