

Neuralink under investigation

Elon Musk's Neuralink is being probed for reportedly killing 1500 animals in clinical trials. <https://digit.in/dec22-13>

Google Photos search feature

Google is working on a search feature for Photos to make it easier to find photographs. <https://digit.in/dec22-14>

AI in automobiles

What, when, and why?

Pramita Bose | feedback@digit.in

A

rtificial intelligence, robotic surgery, aerial taxis, electronic clothing, smart-

watches as fitness trackers, digital payments, human microchip implants, drone delivery, autopilot, driverless technology... you name it and they have it on their watch list. Who? Of course, the prodigious think tank of inventors, ideators, planners, scientists, researchers, designers, manufacturers, et al!

Always thinking out of the box with a futuristic vision, these fertile brains prefer walking the offbeat track to set their class apart. For what had seemed a figment of one's

freaky imagination or a mindboggling concept of science fiction until yesterday, is now emerging as a thing of smart beauty and meeting our eyes as a wonderful reality.

FROM SCI-FI TO REAL WORLD

What if the mind-grabbing dramatic scenes from the epic Star Wars movies or the episodic American TV series Star Trek or closer home, India's answer to the same premise, Space City Sigma, come alive from the small and silver screens right in front of you?

To some automakers, autonomous driving could still appear exotic and remain on paper, while for others, rigorous trial runs are very much underway before green-lighting the wheeled specimens to hit the road.

Unmanned mean machines zipping past on metalled roads, cars stopping automatically at traffic intersections, sedans avoiding accidents in the nick of time, self-driving automobiles saving time and energy with greater speed and efficiency could just sound like rushes straight out of a slick, high-voltage action-packed Hollywood thriller. But on scratching beneath the surface, you'll find these instances pretty tenable. Well, thanks to ingenious AI architectures that make the apparently implausible possible.

Even as experiments on driverless technology continue unabated, it looks all the more 'new normal' in the post-pandemic era. The disruptive
